

South Sudan Population Projections, 2020-2040

National Bureau of Statistics
January, 2016

Preface

Two sets of projections have so far been completed by the Bureau; the first one was the population projection from 2008 to 2015 and the second was from 2015 to 2020. This current document presents projections from 2020 to 2040. This is done to facilitate government plan to achieve the vision of South Sudan. State-level projections are also done to facilitate state-level development planning.

As with the previous projections, the Bureau used component method of population projection. This is done in single year and by sex. The figures are then aggregated to give the five-year figures.

It is the hope of the Bureau that the public, especially the planners use this information.

A handwritten signature in black ink, appearing to read 'Isaiah Chol Aruai', written in a cursive style.

Isaiah Chol Aruai,
Chairperson
National Bureau of Statistics,
Juba.

Introduction to projections

1.0 Introduction

Managing for results is an important principle and is an objective for projecting into the future. This calls for population projections to provide what changes might occur given the assumptions inherent in the projection method and the data. There are a number of techniques for population projection. The Bureau decided to use cohort component method. The method uses the components of demographic change to project the population into the future. These components are births, deaths and migration. It projects the population by age and sex.

The projection built on the 2015-2020 and used the projected figures for 2020 as the base population. The parameters used are those derived from SSHHS 2010 data. These are the age specific fertility rates (ASFRs) and the age specific mortality rates (ASMRs). The ASMRs are the $1q_x$ values in the relevant life tables. The populations are closed to migration in this period.

2.0 The projections

Component method of population projection is used in this computation. And this is done in single years. For the total population P_t with a specified age specific fertility rate and age specific mortality rates, the population under consideration at time $t+1$ is given by $P_{t+1} = P_t - D_t + B_t$

Where

P_{t+1} = Population one year from base

P_t = The base population

D_t = Deaths in the year

B_t = Births in one year

The component method, therefore, removes the expected number of people who should have died as they move to the next age. It adds by sex the new born at age 0. The sex ratio at birth is taken as 103 infant boys to 100 infant girls. The population is closed to migration with the assumption that the number of immigrants equals the number of emigrants. The figures are then aggregated into five-year groups and by sex.

Table 1: Average growth rates for South Sudan and the states for the period 2020-2040

State	r
South Sudan	0.0357
Upper Nile	0.0369
