

Additional Instructions For Four Door Cars & SUVs For Street Dreams Large and Extra Large Suicide Hinges

On these cars, we recommend that the hinge have a 3° to 5° angle from the side. This makes the door look more level when open and let gravity hold the door open. Be sure that the striker and latch are also angled at the same 3° to 5° to close properly.

Notice the inner panel is cut away near the seat belt mount. This will need to be rebuilt with clearance for the hinge

We suggest tilting the hinge up 3° to 5° when in the closed position.

It is VERY important to “recess” the hinge in the quarter panel so that the hinge strap just clears the edge of the quarter panel skin.

Note: The hinges are made in right and left versions. The “top” edge of the mount flange is where the mount holes are closer together.
