

# Merge-and-Shrink Abstractions for Classical Planning

Theory, Strategies, and Implementation

Silvan Sievers

University of Basel, Switzerland

PhD Defense

October 27, 2017

# Classical Planning

## Examples

# Classical Planning

## Examples

## Representation: Transition Systems

# Solving Planning Tasks Optimally

- Transition systems not given explicitly (**too large**)
- **Compact description** of planning tasks
- Use **A\*** with **admissible heuristics**

# Solving Planning Tasks Optimally

- Transition systems not given explicitly (**too large**)
- **Compact description** of planning tasks
- Use **A\*** with **admissible heuristics**

## Merge-and-shrink Heuristics

[Dräger, Finkbeiner & Podelski, 2006; Helmert, Haslum & Hoffmann, 2007]

- Compute **abstraction** of transition system
- Use optimal abstract solution as heuristic

## Merge-and-shrink: Idea

**Factored transition system:** set of small transition systems representing a large transition system (**synchronized product**)

# Merge-and-shrink: Idea

**Factored transition system:** set of small transition systems representing a large transition system (**synchronized product**)

# Merge-and-shrink: Idea

**Factored transition system:** set of small transition systems representing a large transition system (**synchronized product**)

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Merging

Replace two transition systems by their **synchronized product**

# Merge-and-shrink Transformations: Shrinking

Apply **abstraction** to some transition system

# Merge-and-shrink Transformations: Shrinking

Apply **abstraction** to some transition system

# Merge-and-shrink Transformations: Shrinking

Apply **abstraction** to some transition system

# Merge-and-shrink Transformations: Shrinking

Apply **abstraction** to some transition system

# Merge-and-shrink Transformations: Shrinking

Apply **abstraction** to some transition system

# Merge-and-shrink: Ingredients

- Omitted: abstraction mapping, label mapping
- How to merge? → **merge strategy**

# Representing Merge Strategies

 $\Theta_1$  $\Theta_2$  $\Theta_3$  $\Theta_4$

# Representing Merge Strategies

 $\Theta_1$  $\Theta_2$  $\Theta_3$  $\Theta_4$ 

# Representing Merge Strategies

 $\Theta_1$  $\Theta_2$  $\Theta_3$  $\Theta_4$ 

# Contributions

- Expressiveness

Merge-and-shrink  
Framework

# Contributions

# Contributions

# Outline

- 1 Background
- 2 Theory**
- 3 Merge Strategies
- 4 Evaluation
- 5 Conclusions

# Merge-and-shrink Transformations: Label Reduction

Combine different labels to reduce number of transitions

# Merge-and-shrink Transformations: Label Reduction

Combine different labels to reduce number of transitions

## Previous Label Reduction

- Based on **syntax** of underlying planning operators
- Full potential restricted to **linear** merge strategies

# Merge-and-shrink Transformations: Label Reduction

Combine different labels to reduce number of transitions

## Previous Label Reduction

- Based on **syntax** of underlying planning operators
- Full potential restricted to **linear** merge strategies

## Generalized Label Reduction [S, Wehrle & Helmert, 2014]

- **Clear** and **easy** definition
- **Transformation** like merging and shrinking

# Generalized Label Reduction

Apply **abstraction** to the common label set of the factored transition system

# Generalized Label Reduction

Apply **abstraction** to the common label set of the factored transition system

# Generalized Label Reduction

Apply **abstraction** to the common label set of the factored transition system

# Exact Label Reductions

**Locally equivalent** labels: parallel transitions in a transition system

# Exact Label Reductions

**Locally equivalent** labels: parallel transitions in a transition system

# Exact Label Reductions

**Locally equivalent** labels: parallel transitions in a transition system

**Combinable** labels: locally equivalent in all but one transition systems

# Exact Label Reductions

**Locally equivalent** labels: parallel transitions in a transition system

**Combinable** labels: locally equivalent in all but one transition systems

# Exact Label Reductions

**Locally equivalent** labels: parallel transitions in a transition system

**Combinable** labels: locally equivalent in all but one transition systems

# Expressive Power of Merge-and-Shrink

[Helmert, Röger & S, 2015]

What functions can be **compactly represented**  
by non-linear and linear merge-and-shrink?

# Expressive Power of Merge-and-Shrink

[Helmert, Röger & S, 2015]

What functions can be **compactly represented** by non-linear and linear merge-and-shrink?

## Theorem

- Non-linear merge-and-shrink **strictly more powerful** than linear merge-and-shrink

# Outline

- 1 Background
- 2 Theory
- 3 Merge Strategies**
- 4 Evaluation
- 5 Conclusions

# First Non-linear Merge Strategy for Planning

[S, Wehrle & Helmert, 2014]

Adapted from model checking [Dräger, Finkbeiner & Podelski, 2006]

## DFP Merge Strategy

- **Score-based**: assign each merge candidate a value
- Prefer products **fine-grained** in goal region

# Factored Symmetries

[S, Wehrle, Helmert, Shleyfman & Katz, 2015]

## Factored Symmetries

**Goal-stable automorphisms** of a factored transition system

# Factored Symmetries

[S, Wehrle, Helmert, Shleyfman & Katz, 2015]

## Factored Symmetries

Goal-stable automorphisms of a factored transition system

# Factored Symmetries

[S, Wehrle, Helmert, Shleyfman & Katz, 2015]

## Factored Symmetries

Goal-stable automorphisms of a factored transition system

●  $T \Leftrightarrow B, L \Leftrightarrow R$

●  $\rightarrow \Leftrightarrow \leftarrow$

# Symmetry-enhanced Merge Strategies

## What to do with symmetries?

- Shrinking by combining symmetric states

# Symmetry-enhanced Merge Strategies

## What to do with symmetries?

- Shrinking by combining symmetric states
- Theorem: shrinking with **atomic** symmetries is **exact**

# Symmetry-enhanced Merge Strategies

## What to do with symmetries?

- Shrinking by combining symmetric states
- Theorem: shrinking with **atomic** symmetries is **exact**
- Theorem: merging all transition systems affected by a non-atomic symmetry results in an atomic symmetry

# Symmetry-enhanced Merge Strategies

## What to do with symmetries?

- Shrinking by combining symmetric states
- Theorem: shrinking with **atomic** symmetries is **exact**
- Theorem: merging all transition systems affected by a non-atomic symmetry results in an atomic symmetry

## Framework to Enhance Merge Strategies with Symmetries

- Compute symmetries and select one
- In the next iterations, **merge all affected transition systems**
- Otherwise, use fallback merge strategy

# Another Score-based Merge Strategy

**MIASM: maximum intermediate abstraction size minimizing**

[Fan, Müller & Holte, 2014]

# Another Score-based Merge Strategy

MIASM: **maximum intermediate abstraction size minimizing**

[Fan, Müller & Holte, 2014]

**Score-based MIASM Merge Strategy** [S, Wehrle & Helmert, 2016]

- Score: ratio of **alive to total** states in the product system

# Another Score-based Merge Strategy

MIASM: **maximum intermediate abstraction size minimizing**

[Fan, Müller & Holte, 2014]

Score-based MIASM Merge Strategy [S, Wehrle & Helmert, 2016]

- Score: ratio of **alive to total** states in the product system

# Another Score-based Merge Strategy

MIASM: **maximum intermediate abstraction size minimizing**

[Fan, Müller & Holte, 2014]

Score-based MIASM Merge Strategy [S, Wehrle & Helmert, 2016]

- Score: ratio of **alive to total** states in the product system

# Taxonomy of Merge Strategies

# Taxonomy of Merge Strategies

Precomputed  
merge  
strategies

Capture causal  
dependencies

Score-based  
merge  
strategies

# Taxonomy of Merge Strategies

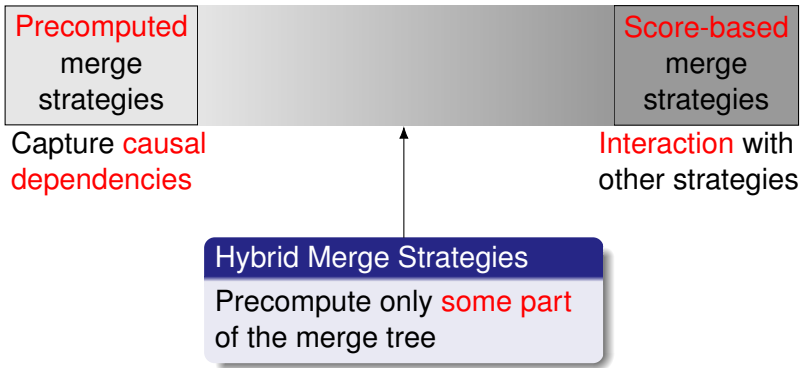

**Precomputed**  
merge  
strategies

Capture **causal**  
**dependencies**

**Score-based**  
merge  
strategies

**Interaction** with  
other strategies

# Taxonomy of Merge Strategies

# SCC Framework for Merge Strategies

[S, Wehrle & Helmert, 2016]

- Precomputation: partition transition systems according to the **SCCs of the causal graph**
- Secondary score-based merge strategy:
  - First merge transition systems within partitions
  - Then merge resulting products

# Outline

- 1 Background
- 2 Theory
- 3 Merge Strategies
- 4 Evaluation**
- 5 Conclusions

# Experimental Study

- Integration into **Fast Downward**

# Experimental Study

- Integration into **Fast Downward**
- Evaluation on planning benchmarks: 1667 tasks
- Typical IPC limits: 30m, 2GB

# Experimental Study

- Integration into **Fast Downward**
- Evaluation on planning benchmarks: 1667 tasks
- Typical IPC limits: 30m, 2GB
- Reporting **coverage**
