# Computational Complexity

---

- > # of resources needed to solve problems **regardless of technology**
  - > **P** =  $\{\Sigma : \Sigma \text{ is decidable in polynomial time}\}$
  - > **NP** =  $\{\Sigma : \Sigma \text{ is decidable in non-deterministic polynomial time}\}$
  - > **PSPACE** =  $\{\Sigma : \Sigma \text{ is decidable using polynomial memory}\}$
  - > **NPSPACE** =  $\{\Sigma : \Sigma \text{ is decidable using non-deterministic polynomial memory}\}$
- $P \subseteq NP \subseteq PSPACE = NPSPACE$**

## Computational Complexity $\cap$ Classical Planning

---

PE- $\mathcal{D}$

**INPUT:** A planning task  $\Pi$  of a domain  $\mathcal{D}$ .

**QUESTION:** Does there exist a plan for  $\Pi$ ?

BPE- $\mathcal{D}$

**INPUT:** A planning task  $\Pi$  of a domain  $\mathcal{D}$  and a positive integer  $K$ .

**QUESTION:** Does there exist a plan for  $\Pi$  of length  $\leq K$ ?

If  $\mathcal{D}$  is arbitrary, then both are **PSPACE**-complete (Bylander, 1994).

# Hamiltonian paths

---

## Definition

A **Hamiltonian path** is a simple path that visits all of the vertices in a graph.

Not all graphs have Hamiltonian paths.

# Hamiltonian paths

---

## Definition

A **Hamiltonian path** is a simple path that visits all of the vertices in a graph.

Not all graphs have Hamiltonian paths.

# Types of grids

---

## Definition

A **grid graph** is a vertex induced, finite, connected subgraph of the integer lattice.

## Definition

A **rectangular graph** is a grid graph whose vertex set is  $\{1, \dots, n\} \times \{1, \dots, m\}$ . It is **squared** if  $n = m$ .

A grid graph

A rectangular graph

## VISIT-ALL: Bounded plan existence

---

Lemma (Follows from Itai. et. al, 1982)

Let  $G = (V_0 \dot{\cup} V_1, E)$  be a squared graph of side length  $n \geq 2$  with  $|V_0| = |V_1| + 1$ .

- >  $s \in V_1 \wedge n$  is odd  $\implies$  the shortest path in  $G$  that starts in  $s$  and visits all vertices has length  $|V| + 1$ .
- > Otherwise,  $G$  has a HP starting at  $s$ . **Always the case if  $s$  is in the middle!**

Let  $K > 0$  and  $I$  be an instance of VISIT-ALL. Then

- > If  $K < |V| - 1$ ,  $I$  cannot be solved in  $K$  steps or less.
- > If  $K \geq |V| - 1$ ,  $I$  can be solved in at most  $K$  steps  
 $\implies$  **BPE-VISITALL  $\in$  P**

## VISIT-ALL: Bounded plan existence

---

 $\implies$  **BPE-VISITALL  $\in$  P**

## VISIT-SOME: Bounded plan existence

### Lemma

The  $s$ - $t$  HP problem on grid graphs is **NP**-complete even if  $\deg(t) = 1$ .

Then

$$K = |V| - 1$$

|                 | PlanEx   | Bounded PlanEx   |

## 3. Future Work

# TERMES

---

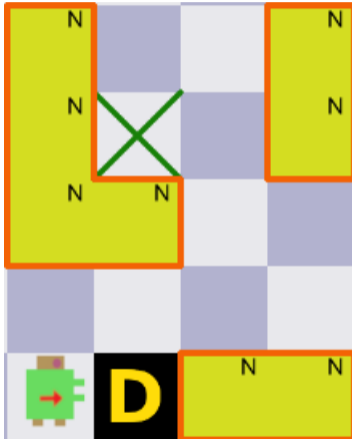

Variant of termite-inspired Harvard TERMES robots.

Demo: <https://editor.p5js.org/trp/full/CN4Bf3bDb>

# TERMES plan existence

---

Goal: Put  $|V| - 1$  blocks in  $X$

# TERMES plan existence

---

If  $\text{num-blocks}_s(u) = N$ , then the robot cannot interact with that cell:

Robot must build a ramp of height  $|V| - 1$  by following an  $s$ - $t$  HP in the grid graph.  
Then the robot must destroy the ramp leading to  $t$ .

# TERMES plan existence

---

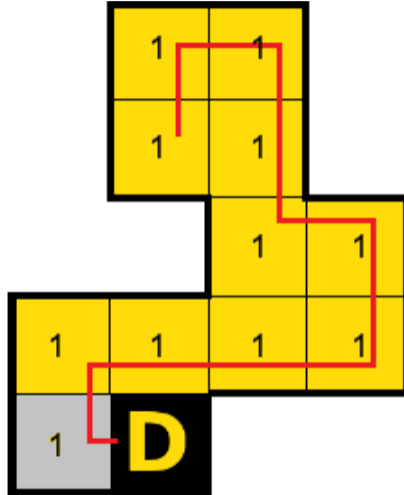

If  $\text{num-blocks}_s(u) = N$ , then the robot cannot interact with that cell:

Robot must build a ramp of height  $|V| - 1$  by following an  $s$ - $t$  HP in the grid graph.
