a PICC line was ordered for long term antibiotic therapy , patient was noted to hvae PVCs and LBBB but was asymptomatic , home cardiac medicines were investigated and restarted.	There has been placement of a right-sided PICC line whose distal lead tip is in the superior SVC. r picc 56cm, brachealcephalic svc junction. Compared to the previous tracing of ventricular premature contractions are new.	4/6	70.2	28
On her right chest tube was removed without complications .	There has been interval removal of the right chest tube .	1/2	88.0	22
IUFD : Ms. was followed by social work during hospitalization for her IUFD .	41 year old woman with recent pregnancy, s p stillbirth .	0/2	69.8	9
The patient was started on a heparin infusion for the left ventricular thrombus and, while the patient was still in the cardiac catheterization laboratory, a coronary sinus wire was placed for pacing.	has apical thrombus by echo- on heparin iv, eventually will need coumadin. A transfemoral venous pacing wire is noted to terminate with its tip in the region of the coronary sinus . An additional catheter is advanced through the IVC and also terminates in the right ventricular outflow track.	0/4	83.0	41
