

Assessing the Economic Impact of the 2024 Baltimore Bridge Collapse using RDF/OWL to Crosswalk the NAICS, SICS and GICS Industry Classification Systems

Christopher N. Carrino^{1,*†}

¹U.S. Census Bureau, 4600 Silver Hill Road, Washington, DC 20233, United States

1. Introduction

In the early morning of March 26, 2024, the Francis Scott Key Bridge in the Port of Baltimore collapsed after having one of its piers struck by the container ship DALI. Six members of a maintenance crew working on the bridge at the time of the collapse lost their lives. In the days and weeks that followed, the city of Baltimore suffered subsequent economic impacts, estimated at \$15 million per day [1]. The port re-opened to full maritime operations on June 10, 2024. This industry track paper presents a model of the various impacts mentioned in media articles that covered the bridge collapse. The W3C Web Ontology Language (OWL) is used to identify key industry classes of the port's cargo traffic and use features of OWL to cross-walk various industry classification systems.

2. Methods

The various impacts of the bridge collapse are modeled at high level in Figure 1. This OWL model is based on the ECLAC 2003 [2] system of measuring disaster related damages including human impacts and economic impacts. This paper focuses specifically on the economic impact caused by the loss of imports and exports of commodities and roll on/off cargo and is intended to assist industry analysts and data scientists using differing classification systems in their research. The full economic impact is broken down by the impact from bridge collapse and the impact from the Port of Baltimore being restricted for shipping. Impacts related to the bridge collapse are more relevant to the local community whereas impacts from the port closure may have a national and even a global impact. The time-frame also differs significantly as the Bridge collapse is expected to be rebuilt by 2028 (4 years) whereas the Port closure lasted for 76 days.

A classification system is by its own name, a system of classes and OWL provides a formalized class model. OWL features an Annotation property "owl:equivalentClass" for equivalent OWL Classes and uses the Data property "owl:sameAs" for identical OWL Individuals. It is important to note that in OWL, equivalent does not necessarily mean identical. Equivalence applies to two separate things that share the same extension of properties and subclasses. Identity applies to a single individual that has been represented more than once. Since we have modeled each of the four Industry

Classification Systems using classes, we will cross-walk the systems using equivalence as opposed to identity.

	Level 1	Level 2	Level 3	Level 4	Level 5	Total
SICS (2007)	Division	Major Group	Industry Group	Industry		
	10	83	415	882		1390
NAICS (2017)	Sector	Sub-Sector	Industry Group	Industry	Sub-Industry	
	24	99	311	709	1057	2200
GICS (2008)	Sector	Industry Group	Industry	Sub-Industry		
	11	25	71	165		272
ISIC (rev4)	Section	Division	Group	Class		
	21	88	238	419		766

Figure 2: Industry Classification System Comparison

The first step performed in this study was to model each of the four industry classification systems into an OWL model. Figure 2 shows a high level comparison of the four systems obtained by summarizing their respective OWL model. The second step was apply the owl:equivalentClass Annotation property to the equivalent classes across each model. We obtained a set of 2270 cross-references between NAICS and SICS [3], and a set of 1655 cross-references between NAICS and ISICS [4]. NAICS is the only of the four systems to provide internal cross-references to identify class equivalence within its own set of classes [5]. After performing these two steps, the resulting crosswalk shown in Figure 3 was generated for the commodities most affected by the Baltimore Bridge Collapse.

Commodity	System	Level 1	Level 2	Level 3	Level 4	Level 5	Label
Coal	GICS (2008)	10	1010	101020	10102050		Coal & Consumable Fuels
	ISIC (rev4)	B	05	051	0510		Mining of hard coal
	NAICS (2017)	21	212	2121	21211	212111	Bituminous Coal and Lignite Surface Mining

Figure 3: Crosswalk of Selected Commodities

3. Notes

Listing of all Classification Systems reviewed during this study:

- Standard Industrial Classification (SIC) 1938, OMB
- International Standard Industrial Classification (ISIC) 1948, United Nations
- North American Industry Classification System (NAICS) 1997 - OMB / ECPC
- Global Industry Classification Standard (GICS) 1999 - Standard & Poor's (S&P)
- Harmonized System (HS) 1988 - World Customs Organization (WCO)
- Standard International Trade Classification (SITC) 1950 - United Nations
- End-Use Commodity Category - Bureau of Economic Analysis
- Advanced Technology Products (ATP) - USCB
