How BIG is 1 000 000 exactly?

1♥ = 1 EW project

Blue whale - the largest animal on Earth, weights 200t (200 000kg).
If 1kg is 1 EmbeddedWiki project, the EmbeddedWiki platform would be the size of 5 BLUE WHALES!

1' = 1 EW project

The average project reading time on EmbeddedWiki is 15 minutes.
If you were to start reading projects now, continuously without interruption, it would take you 28 years to read every project on the platform.

From one man's idea to a dominant add-on board standard

The entire company works towards a shared vision – to save time of our fellow engineers. Click boards™ product line constitutes a key component of the future we have envisioned.

Development boards are substantially similar: they integrate a microcontroller, power supply, tact switches, LEDs, pins. The features that differentiate development boards are the peripherals such as UART, 7-seg digits, RTC, Relay, ADC, EPROM, and the like. Different projects, however, require that a different peripheral be used each time. If peripherals on a single board could be changed, its functionality would improve significantly.

Presented with the problem, I started looking for a solution: how to change peripherals easily and what to add to a board to be able to do so.

I remember the very moment when I hit upon the idea of the mikroBUS™ standard - the very first drawing of it I made in the sand and later on a piece of paper. In fact, my family was on holiday in a hotel - Hillside -Su - in Antalya (Turkey), and the hotel played a key role in the story of mikroBUS™ standard: there was a play area for children and an even better one - in the shade and roomy - for babies and for my papers and data-sheet. Amid the papers and babies, as I was keeping an eye on my five-year-old daughter Lena, mikroBUS™ standard came to life.

The name was chosen by one of my colleagues a long time ago: 'click' is what you hear when you place the Click board™ onto the development board. 'It just Clicks' is a marketing message we wish to convey.

The shape and end-dimension of the Click board™ posed a great challenge. Now that we have made more than thousand Click boards™, it is easy to notice that all WiFi, LTE, BLE, GSM, GPS modules, OLED screen, and 7-seg digits fit Click boards™ perfectly, and that the size is right. However, dimension check requires that the components and modules

classification on a single Click board™ be reviewed and several hundred datasheets be opened. I take pride in our solution: this part of the Click boards™ story looks like a simple task; however, without it, there would be a great decrease in the number of Click boards™ created.

Back at work, I called a meeting and presented my idea: I spoke about the pins I chose and why I chose those very pins; I explained what the overarching goal was and provided other relevant information. It was in that meeting that we revised the statement and increased the functionality of the mikroBUS™ standard by adding a few more pins, so that there was a total of 16 pins - 8 in each row. We now know that this is by far the smallest number of the pins one can use and which account for most chips, modules, and other components you could place on Click board™.

1700 Click boards™ is a huge milestone since not a single company in our industry has that number of peripheral boards.. We made history in reaching that number. More importantly, the mikroBUS™ standard has proven to be very usable: if you can design thousands of different Click boards™ on one standard and create another thousand and then another thousand, that means that the standard is quite exceptional.
