

Cleaning & Maintenance Information

A feather duster is ideal for regular day-to-day cleaning of glass. If a more thorough cleaning of glass is necessary, the following materials and methods should be used:

Materials –

Soft lint free cloth (do not use coarse brown paper towels), and a non-abrasive, non- ammonia glass cleaner. Avoid abrasive materials and solutions.

Method –

Spray the cloth lightly with cleaning solution. Dab the cloth softly on the glass surface to remove dust and lint. For more heavily soiled areas, use a light circular motion to remove dirt. Clean all accessible surfaces of the glass.

Note –

Automatic cleaning equipment should **not** be used to clean the glass. We also do not recommend the usage of mops and water/soaps that are typically used when cleaning other flooring surfaces. Both of these can damage or cause issues with the glass.

Glass, like all other functional products, will greatly benefit from a program of routine maintenance. While regular cleaning of the glass is the most obvious aspect of a maintenance regimen, it is also important to inspect the condition of adjacent materials such as grouts, adhesives, fasteners and hardware.

Architectural glass should be reviewed at least annually in order to ensure that related components are performing adequately. Special attention should be paid to the silicone used to install the glass. Any imperfections in this material should be replaced immediately.
