DANFOSS ABQM PRESSURE INDEPENDENT CONTROL VALVES

The AB-QM has a linear control characteristic. The AB-QM is pressure independent which means that the control characteristic is independent from the available pressure and is not influenced by a low authority.

The flow limitation on the AB-QM is achieved by limiting the stroke and the Danfoss actuators calibrate to the stroke of the valves. This means that the AB-QM keeps its linear characteristic independent of the setting or differential pressure.

Because of the predictable characteristic the actuators on the AB-QM can be used to change the response from linear to logarithmic (equal percentage).

That makes the AB-QM suitable for all applications, including AHUs, where the equal percentage characteristic is needed to get a stable control loop.

The actuators can be switched from linear to logarithmic by changing a dipswitch setting on the actuator.

DANFOSS AB-QM 4.0 PRESSURE INDEPENDENT CONTROL VALVES

The Danfoss AB-QM is a Pressure Independent Control Valve (PICV) that combines high accuracy and durability with market leading user-friendliness. The design of the AB-QM is fully geared towards making your project run on time and on budget while delivering the most efficient HVAC system.

Pressure independent valves are control valves with an automatic balancing function. An in-built pressure controller keeps a constant differential pressure over the control valve, ensuring full authority and automatic flow limitation. By combining two functions in one, control and automatic hydronic balance, Danfoss PICVs provide a cost-efficient solution for the challenges faced by forward-looking designers of HVAC systems.

Danfoss AB-QM was the first of its kind control valve for HVAC heating and cooling applications. AB-QM 4.0 is its next level successor.

The basic principles haven't changed; It is a control valve with automatic flow limitation and built-in differential pressure controller. The control performance is very accurate and the valve has a – still – unique valve authority of 100%.

But the value the AB-QM 4.0 valves provide has improved a lot. AB-QM 4.0 is the best-in-class PICV currently on the market. The AB-QM 4.0 becomes available in DN 15 up to DN 20HF. There are versions with and without test plugs. And versions with internal or external thread connections. The flow capacity increases to a broad range of 20 l/h up to 6,000 l/h and can accurately be measured with the PFM 1000 measuring instrument via Bluetooth on iOS and Android devices.

AB-QM 4.0 is engineered to be the indisputable best PICV on the market. For example, it has a scaling & clogging resistant design, PN25 Nominal Pressure, accurate flow measuring and bi-directional filling and flushing. These provide many advantages for designers, installers, and end-users.

PICV's increase the energy efficiency of HVAC heating and cooling systems. AB-QM 4.0 is designed for terminal units such as fan-coil units, climate ceilings and chilled beams. Equipped with one of our actuators they accurately control the room temperature and improve the indoor climate. In case it's equipped with our digital actuator, NovoCon S, it enables HVAC 4.0 systems for smart buildings with Internet of Things (IoT) solutions.

FLOWCON GREEN AND SM PRESSURE INDEPENDENT CONTROL VALVES

The FlowCon Pressure Independent Control Valves combine 3 functions in one valve housing:

- Modulating control;
- Dynamic flow limitation;
- Differential pressure control.

FlowCon PICVs are widely used in heating and cooling applications due to their accuracy and energy saving potential. The valves offer 100% control authority for all flow conditions, through a programmable choice of either linear or equal percent control characteristic. Flow balancing of the system is automatic and independent of pressure change within the system. The FlowCon PICV range includes two families, "Green" and "SM", which are both are tested to BSRIA BTS 1/2019 standards.

FlowCon Green

The female threaded Green range covers multiple control ranges and offers flexibility and serviceability through the removable PICV valve insert up to 1½".

Green valves are fitted with 2 PT plugs (standard) with other options available on request, including PT plug & Combined PT plug and drain.

WATER LEAK DETECTION SYSTEM

The Merlin WDP is a water leak monitoring system that has been specifically designed to help achieve the requirements of 2018: 1.0 BREEAM UK New construction (non-domestic buildings).

The WDP system will allow designers, M&E contractors and developers to achieve the 'Credit' available to reduce the impact of water leaks that may otherwise go undetected.

All the leak detection water meters and solenoid valves are WRAS-approved.

The system is designed to monitor water flowing through a pulse water meter. If the volume of water reaches the pre-set limit (customer adjustable) the system can isolate the mains water pipe, therefore limiting the amount of water and leak damage.

FEATURES

- Achieves one credit from BREEAM WAT 03
- Timer & programmable clock built in
- Two stage monitoring for occupied and unoccupied buildings
- BMS output available
- 2 zone input for reading 2x water meters (boundary and incoming)
- Volt free normally closed input for emergency stop buttons, fire alarm & security systems
- Remote sounder strobe output
- 230VAC & 24VDC outputs for water solenoid valves

WATER METER GUIDELINES

GENERAL TERMS OF REFERENCE AND SIZING

1. Maximum flow is only for use in emergencies, for about 1-2 minutes as it causes the bearings to overheat.
2. Minimum flow only refers to the minimum flow required to operate and record on the meter. At these very low flows, the meter will not be accurate .
3. All water meters should be sized between transitional flow (the point at which the meter is accurate) and nominal flow (everyday flow rate).
Never use maximum flow as a basis for sizing the meter.

FILTRATION

4. The meters are designed only for use with clean water. A filter is always recommended upstream of the meter if there are any concerns.
This filter should also have straight pipe of at least 10x diameters of the pipe from the meter to allow the flow to settle again.
For example, a DN25 (1") meter would need 250mm (10") between the filter and the meter.

INSTALLATION

1. The preferred mounting position is horizontal with the dial facing upwards. Not to be mounted vertically. Never put the meter upside down or canted on its side as it will not function correctly .
2. Water meters should always be fitted with a minimum of 10x pipe diameter both up and downstream.
For example, a 2" (Dn50) water meter would have 20" (500mm) either side of the meter as straight pipe.
This is to ensure accurate reading by reducing water turbulence. At higher pressures (above 8 bar), this should be increased to 10x pipe diameter.
3. Note that there is a direction of flow arrow on the meter. Also, that the meter has the size in mm on one side and the maximum flow on the other in metres cubed per hour. Remember that the meter must only be used for half of this maximum flow for constant use, maximum flow only being used for short periods of 1-2 minutes.
4. It is recommended as good practice to fit a removeable filter element before a water meter to protect the mechanism.
5. Only clean water should be used that does not exceed the temperature specification of the meter.

TEMPERATURE SPECIFICATION IS 30°C FOR COLD METERS AND 90°C HOT METERS

Certain inhibitors used in heating systems can damage the meter body, mechanism or the seals. This damage could cause leaks or failure of the meter.

6. When installing the reed switch (pulsed output wire), the distance from the meter to the control unit/pulse counter is best kept under 20 metres as voltage will drop.

The reed switches are normally open, volt free, but operate on the 0-24VDC range when the pulse is made. A magnet on the water meter will close the switch to form the circuit when the designed pulse for that meter is reached. This then sends a signal to the control unit/pulse counter. The two wires that leave the pulse cable attached to the meter are not polarity sensitive.

LOCATION

Water meters should never be installed where there is a risk of water ingress, for example, underground or exposed to the elements at any time. Additionally, they should not be exposed to extremes of temperature. Like any other fitting, freezing can damage the dial mechanism and crack the meter body. Meters should always be protected from these risks.

ELECTRO THERMAL FUSIBLE LINK

Electro thermal fusible link for use in boiler houses.

The electro thermal fusible link is for installing in a position where a fire hazard may occur, e.g. above a burner, an air heater or boiler. The fire will melt the fusible metal link and interrupt the electrical supply to either a gas valve or an alarm etc.

The link consists of a purpose built cast aluminium box with a perforated cover having a temperature sensitive fuse. The unit should be mounted so that the perforated cover faces downwards and the ventilation holes in the back of the box must not be obstructed.

The link is electrically rated at 5 amps maximum on 200/250volts, single phase, 50 hertz and melts at 72°C.

GENERAL PURPOSE CARBON DIOXIDE TRANSMITTERS

Measuring CO₂ is the most economical way to monitor both indoor air quality (IAQ) and human presence with one sensor. Inadequate ventilation results in elevated CO₂ levels, causing drowsiness and decreased productivity. Good indoor air quality can be achieved based on occupancy levels. Energy is saved by minimizing the use of unconditioned outside air. 5-year warranty is valid for instruments purchased through us.

Analogue monitor with display and relays

The AX-AM8DR is a cost effective solution to display and monitor a selection of 10V or 20mA analogue signals, loop power is provided for current sensors. Each of the 8 input signals is individually scaled before being displayed, allowing a mixed combination of sensor ranges. Each input has a limit relay with independent setpoints, reversing the on and off setpoints inverts the relay action. The limit relays are also combined to drive a common alarm relay to reduce wiring.
