

Model Checking Contest results for 2016

Fabrice Kordon — LIP6, Univ. P. & M. Curie, France

Hubert Garavel — Inria/LIG, France

Lom Messan Hillah — LIP6 & Univ. Paris Ouest Nanterre, France

Francis Hulin-Hubard — LSV, CNRS/ENS de Cachan, France

Emmanuel Paviot-Adet — LIP6 & Univ. Paris Descartes, France

Loïc Jézequel, IRCCyN, Univ. Nantes, France

César Rodríguez — LIPN, Univ. Paris 13, France

MC2
2016

🌐 Promoting model checking tools

- 🌐 Compare and debug

 - ▶ Oracle handled by the developers themselves

- 🌐 Enhance reproducibility of results

 - ▶ BenchKit + dedicated environment using virtualization (easier replay)

 - ▶ Submissions available online

- 🌐 Encourage tools and tool support

 - ▶ Observatory for the community

 - ▶ Provide reusable and fair comparison charts and data

🌐 Creating a common database of benchmark

- 🌐 Models from various origins (more to tell later)

 - ▶ PNML is a good format for this

🌐 Competing tools not only dedicated to Petri nets

- 🌐 Tools coming from other communities

22 d, 8h (Included in total CPU)

«known» models

- Those from past years

- ▶ Test the tool as used by its developers

«Stripped» models

- «known» (original archive) and set as «surprise» ones

- ▶ Test the tool as used by «non experts» of the tool

«Surprise» models

- New models proposed by the community this year

- ▶ Test the tool as used by «non experts» of the tool

- ▶ new situations for the tool

«known» models

- Those from past years
 - ▶ Test the tool as used by its developer

«Stripped» models

- «known» (original archive) and set as «surprise» ones
 - ▶ Test the tool as used by «non experts» of the tool

«Surprise» models

- New models proposed by the community
 - ▶ Test the tool as used by «non experts»
 - ▶ new situations for the tool

Coefficients (after pool)

«known» = x1

«stripped» = x3

«surprise» = x5

Execution consistency

On the same machine

«known» / «stripped»
colored + associated P/T

May 1st, delivery of disk images

- Qualification phase
- Completed by mid May
 - ▶ ~37 500 test runs

May 17, starting to operate tools

- 128 682 runs distributed over 4 different machines over Europe
- VM with 4 cores / 16GB
 - ▶ ITS-Tools, LTSMIn, TAPAAL(PAR), LoLa
- WM with 1 core / 16 GB
 - ▶ Marcie, PeCan, pnmc, PNXDD Tapaal (SEQ, EXP), ydd-pt
- Time confinement, 1h

Mid June, consolidation + analysis of outcomes

- 31 GByte of logs and CSV files

- ▶ Post analysis = ~18KLOC Ada + ~800 LOC bash

Analysis Protocol

- Pass 1, computing results for the majority in a «line»

- ▶ All tools for an examination for a model instance

- Pass 2, evaluating tool reliability

- ▶ Only considering values with a large majority

- Pass 3, reconstructing the results using tool reliability

- ▶ Help to decide when only 2 different answers

- ▶ A result must be of confidentiality 0.93 or more (0.9 in 2015)

- ▶ Some results are tagged «insecure»

- Pass 4 computing scores

- ▶ «insecure» results not considered when counting points

Mid June, consolidation

- 31 GByte of logs and CSV files
- ▶ Post analysis = ~18KLOC Ada +

Analysis Protocol

- Pass 1, computing results for the majority in a «line»

- ▶ All tools for an examination for

- Pass 2, evaluating tool reliability

- ▶ Only considering values with

- Pass 3, reconstructing the results

- ▶ Help to decide when only 2 different answers

- ▶ A result must be of confidence

- ▶ Some results are tagged «insecure»

- Pass 4 computing scores

- ▶ «insecure» results not considered

Scoring

StateSpace, 10 / 2 / 2 / 2
Deadlock, 16
Other formulas, 1 per formula

Bonus for a «line»

+4 for the fastest tool
+4 for the smallest memory footprint

Penalty for mistakes

Twice the score for a good value
No bonus if at least one error

Consistency checks

- Colored versus equivalent P/T nets
- «known» models versus «stripped» models

Computing the «reliability rate»

- Section III.2 in <http://mcc.lip6.fr/rules.php>
- Computing \mathbf{V} , the set of values with a majority of 3 and more tools
- For each tool t , selecting \mathbf{V}_t , the values computed $\in \mathbf{V}$
- For each tool t , selecting $\mathbf{V}_{\#}$, the correct values computed $\in \mathbf{V}$

- Reliability rate =
$$\frac{|\mathbf{V}_{\#}|}{|\mathbf{V}_t|}$$

MCE 2016 Tool Reliability in 2015

Counting transitions for StateSpace

- Discussion about semantics (consistency P/T versus Colored)

Handling some rare bugs in the benchmark

- Possibly on one surprise model

Small «almost surprise»

- Some instance of GPPP with more than 2^{32} tokens...

Better generator for LTL

- Possible use of SPOT

Please check carefully your logs

- Some discussion issues already started

MCC 2016 As a Conclusion...
