Queue machines

It is dull to wait in the line.
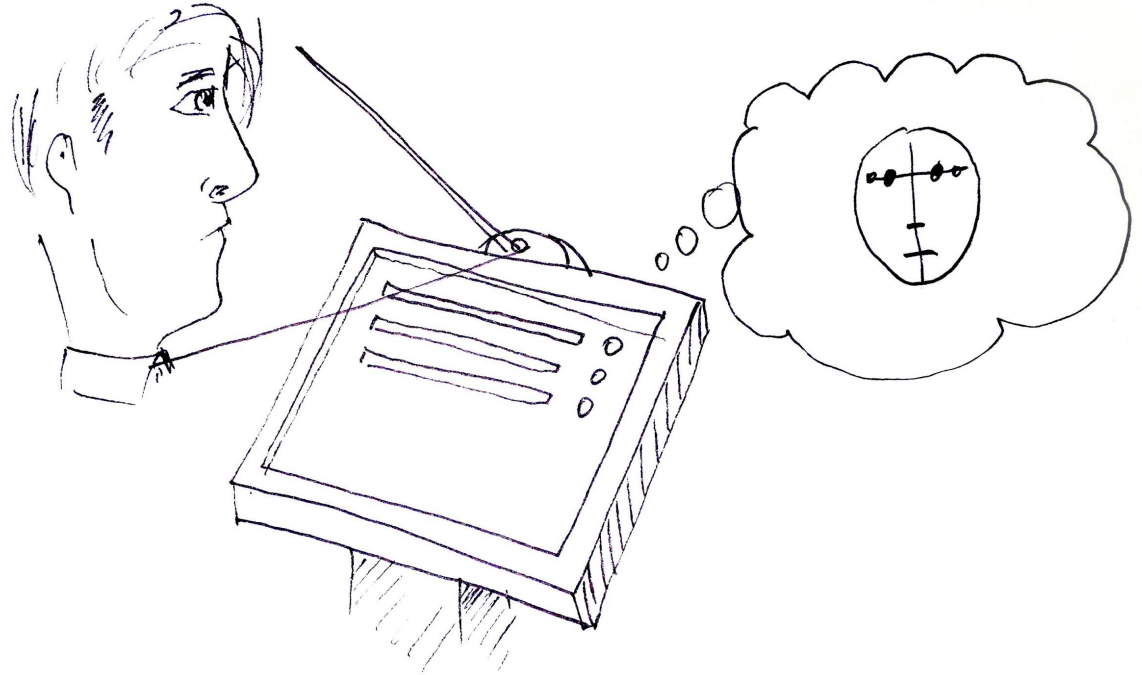

Not very personal, numbering people is very dystopian.
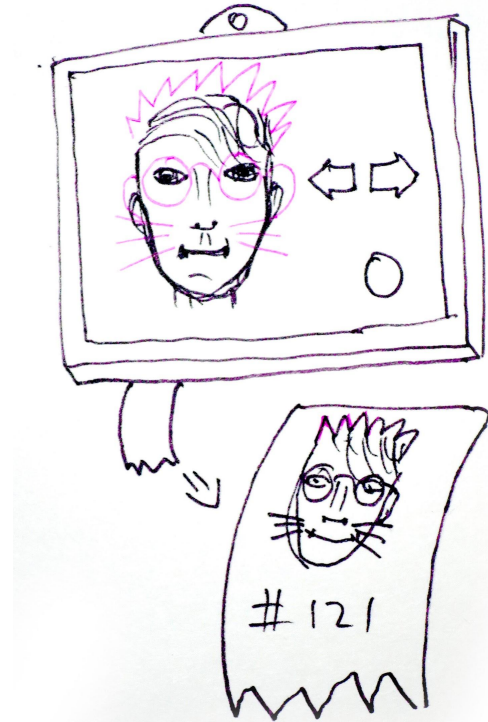

Make it funny!

Add camera and face recognition module to the ticket machine.

Create friendly caricatures via image processing or adding some stuff.

How it works

-A user presses the button to get a queue number

-The hidden camera takes a picture of the user

-The picture is processed using the face detection

-The queue ticket machine prints the ticket with the queue number and the processed picture of the user

How it works

-The queue visualization on the
screens contains not only numbers,
but also the portraits.
