### **A Comprehensive Mouse Transcriptomic BodyMap across 17 Tissues by RNA-seq**

Bin Li<sup>1,2#</sup>, Tao Qing<sup>1,2#</sup>, Jinhang Zhu<sup>1</sup>, Zhuo Wen<sup>1,3</sup>, Ying Yu<sup>1,2</sup>, Ryutaro Fukumura<sup>4</sup>,  
Yuanting Zheng<sup>1,2\*</sup>, Yoichi Gondo<sup>4\*</sup>, and Leming Shi<sup>1,2\*</sup>

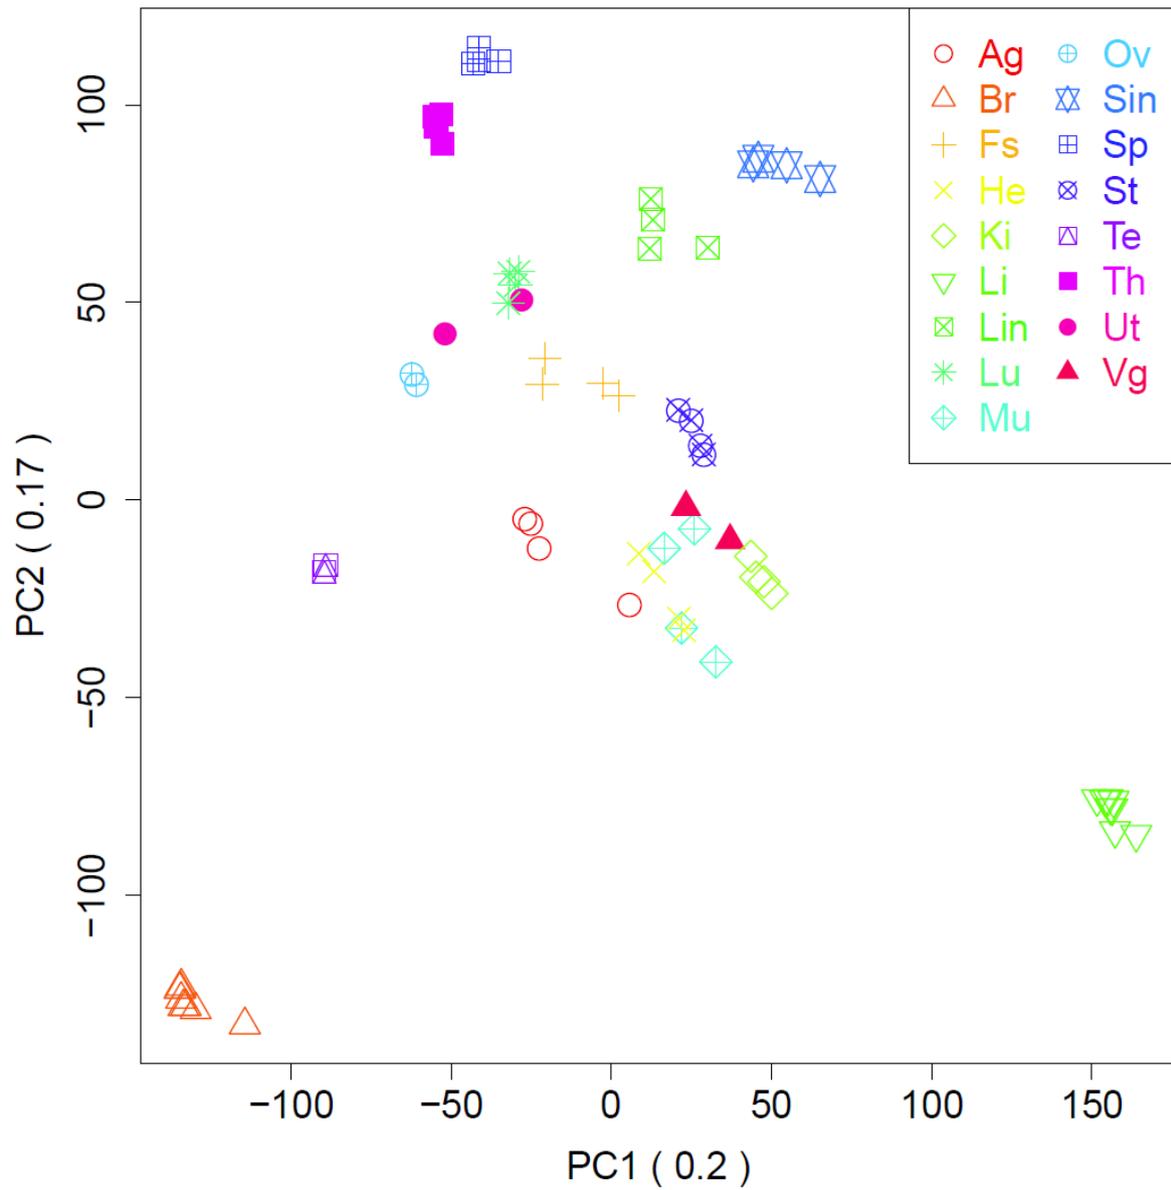

\*To whom correspondence should be addressed (yuantingzheng@fudan.edu.cn, gondo@riken.jp, or lemingshi@fudan.edu.cn).

16 **Supplementary Figure S1. Hierarchical clustering analysis of all 72 samples.** Each  
 17 column indicated a sample, whereas each row indicated a gene. Each tissue symbol was  
 18 shown upon the color bar for each cluster. The mouse information where each sample came  
 19 from was also labeled upon the color bar. Mouse 1 and Mouse 2 were two male mice (in blue  
 20 text), while Mouse 3 and Mouse 4 were two female mice (in red text) as shown in Table 1.  
 21 One of the bone marrow sample was not clustered together with the other three bone marrow  
 22 samples, indicating that there may exist problems such as a mislabeling with this sample.

23 **Supplementary Figure S2. Number of expressed genes under two different thresholds**  
 24 **(0.1 and 1) given the number of tissues.** FPKMs were averaged over all replicate samples in  
 25 a given tissue. The gene expression distribution was complementary between PCGs (left  
 26 panel) and ncRNA (right panel).

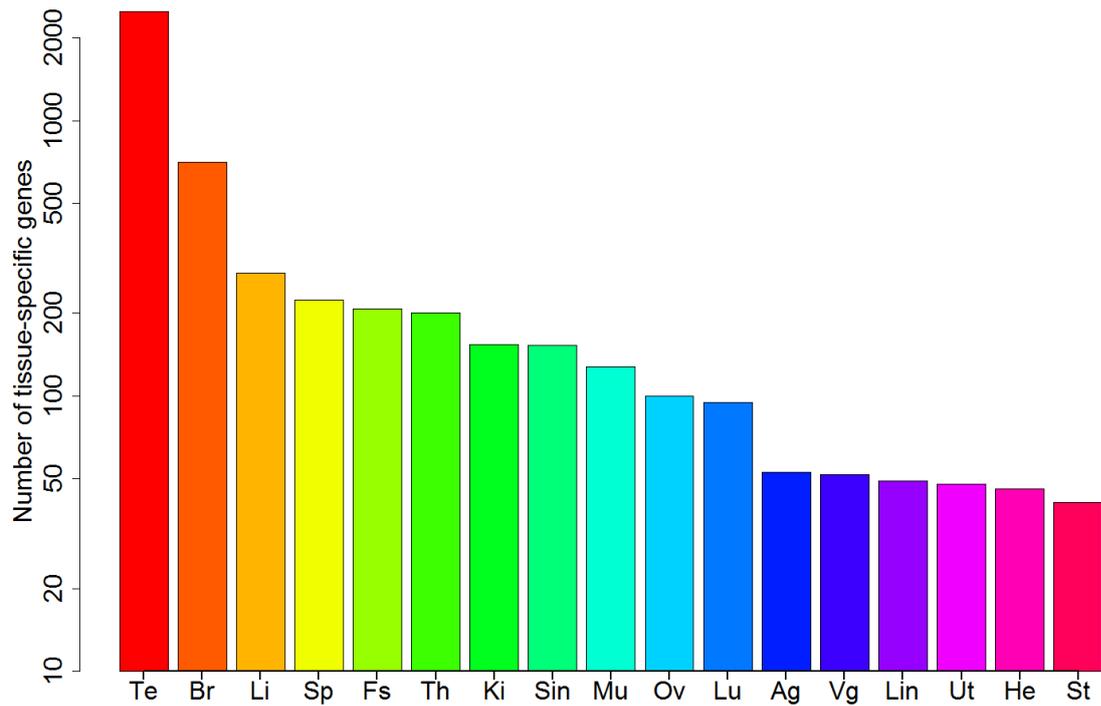

27 **Supplementary Figure S3. Principal component analysis of the expression profiles of the**  
 28 **68 samples.** Biological replicates from the same tissue were clustered together.

29

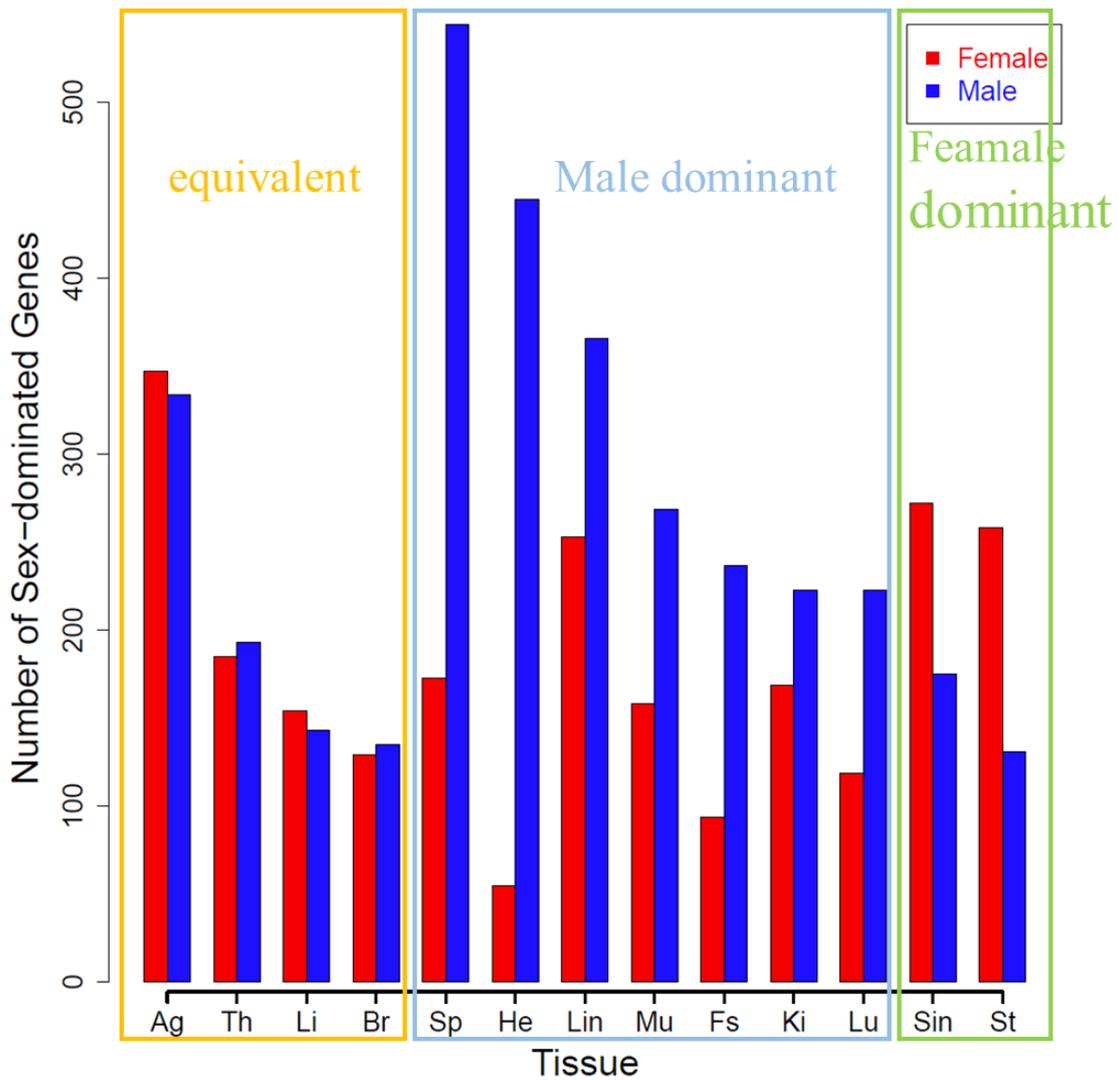

30 **Supplementary Figure S4. Pairwise DEGs across all samples.** Upper panel: protein-coding  
31 genes (PCGs); lower panel: ncRNA genes. For each tissue in each column, the figures  
32 indicated the numbers of down-regulated genes comparing this tissue to the other tissues. For  
33 each tissue in each row, the figures indicated the numbers of up-regulated genes comparing  
34 this tissue to the other tissues. The tissues are in the same order as in Figure 1C.

35 **Supplementary Figure S5. Number of tissue-specific genes.** Testis harbored the most  
 36 tissue-specific genes (2,496), closely followed by brain (708) and liver (280). The numbers of  
 37 tissue-specific genes identified in the other ten tissues ranged from 41 to 223.

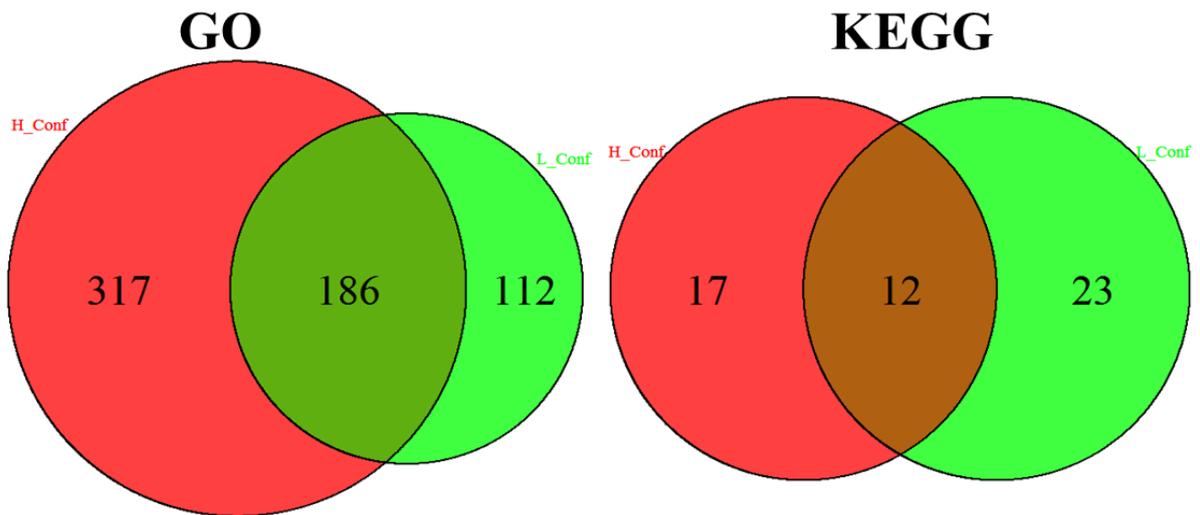

38 **Supplementary Figure S6. Sex differences of rat transcriptomic profiles.** Each scatter  
 39 plot indicates the gene-expression level (expressed as log<sub>2</sub>FPKM) of male (y axis) against  
 40 female (x axis) mouse for a given tissue among the thirteen non-sexual tissues. Male and  
 41 female dominated genes are highlighted in blue and red, respectively.

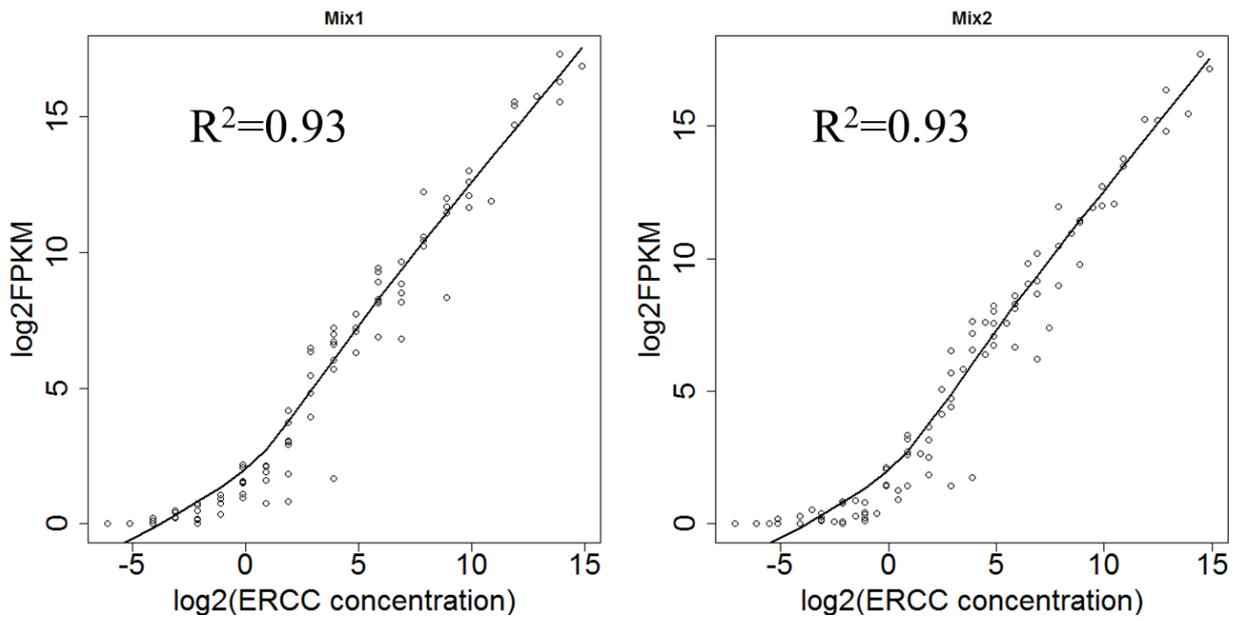

42 **Supplementary Figure S7. Number of sex-dominated genes across all non-sexual tissues.**

43 Spleen, heart, large intestine, muscle, forestomach, kidney and lung expressed more  
 44 male-dominated genes, whereas small intestine and stomach expressed more  
 45 female-dominated genes.

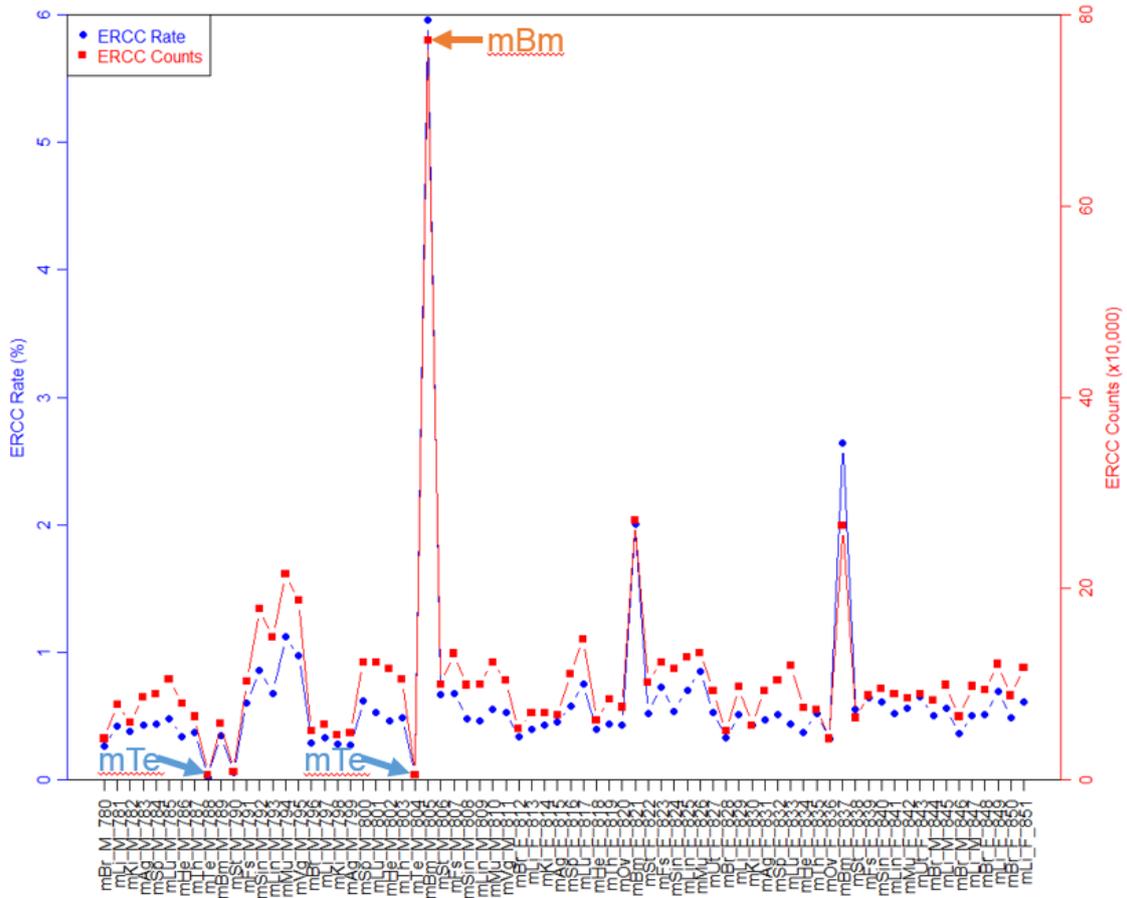

46

47 **Supplementary Figure S8. Number of GO terms and KEGG pathways significantly**  
 48 **enriched with the 4,781 house-keeping genes by groups.** Red: number of GO terms or  
 49 KEGG pathways by genes with high confidence; Green: number of GO terms or KEGG  
 50 pathways genes with relatively low confidence. Left panel: GO terms, right panel: KEGG  
 51 pathways.

52 **Supplementary Figure S9. High correlation found between the calculated ERCC levels**  
53 **(y axis, log2FPKM) and the theoretical values (x axis, log2[ERCC concentration]). Left**  
54 **panel: Mix 1, right panel: Mix 2. The calculated values agreed well with the theoretical ones**  
55 **( $R^2=0.93$ ).**

56 **Supplementary Figure S10. ERCC mapping ration and counts.** Left y axis: ERCC rate  
 57 (the blue line); Right y axis: ERCC counts (the red line).

58 **Supplementary Table S1. Isolation of total RNA.**

59 The “UniqueSampleID” column was used for naming raw fastq data files. For each sample  
60 ID, for example, “mBr\_M\_6w\_1”, “mBr” stands for tissue (including 18 different types of  
61 tissues), “M” stands for sex (M for male and F for female), “6w” stands for age, “1” stands

62 for animal replicates (including two male and two female mice, numbered as 1,2,3,4), and “b”  
63 stands for RNA sample replicate which only occurred in brain, liver, kidney, and testis. It  
64 should be noted that each pool was loaded onto two lanes of a flow cell for sequencing.

**Supplementary Table S2. Read counts summary and mapping stats of all samples.**

SampleID	ReadCounts	ReadsAfterTrimming	ReadsRemoved	TrimmingRate (%)	OverallMappingRate (%)	ERCCReads	ERCCRate (%)
