

**Table 3:** SIGffRid predictions related to the SigR target sequence (classification of genes according to the classification scheme for *S. coelicolor* available on [http://www.sanger.ac.uk/Projects/S\\_coelicolor/classwise.html](http://www.sanger.ac.uk/Projects/S_coelicolor/classwise.html)).

- (1) Motif identified upstream the CDS:  $GGAATN_{\{16,19\}}GTT$
- (2) Motif identified upstream the CDS:  $GGGAAN_{\{18,20\}}CGTT$
- (P) Direct targets of SigR previously reported in Paget *et al.* 2001

Note: genes sharing the same motif can have the mention “see GeneID page PageNr” instead of the motif, most of the time in case of operon organization (motif is given in front of first gene). Motifs can occur in CDS: we search for in upstream sequences of CDS, intergenic or not. Upstream sequences overlapping each other on the same strand (according to downstream genes) are merged. In this case, it is difficult to affect a motif to a gene: motif is given at front of the more probable possibly regulated gene, and other overlapping downstream genes sharing the same motif have the mention “see GeneID page PageNr”.
