

CUSTOM MADE FOOTWEAR

IF YOU'RE LOOKING FOR THE PERFECT SHOES

Dr. Orto

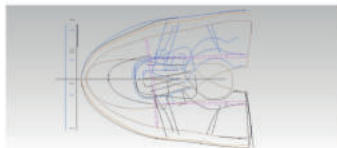

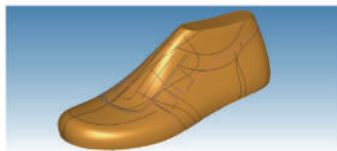

INNOVATIVE TECHNOLOGY

Compared to traditional manual design, the biggest advantage of our 3D shoe design system is that it enables designing nicer and better models, and it's also easier to transition necessary changes for the one-piece-flow.

The form, sizes and ratios of a footwear is defined by a last. Our last concept developed in the past few years, our huge last park and the computer preparation of patterns adapted to different lasts results in us being capable of making perfectly designed custom-made shoes for plenty of unique size variations. We offer nearly more than 100 women's and 80 men's basic models with tops with different closures and sole variations. The possibilities provided by the model determine for how many different lasts the basic pattern of one model has been created. While designing our models, we paid special attention to avoiding internal seams and pressure points.

Custom fitting is aided by 3D foot scanners. Our footwear is provided with an anatomically suitable insole. Our unique insole design is supported by the Spanish Voxelcare 3D design system. In case of special deformities there's a 3D scanner available for perfect fitting.

A key element of orthopedic and diabetic shoes is the sole which needs to be sufficiently rigid, durable and non-slip, also must provide a good support, while it can't be heavy. For proper relief and easier walking, it's always helpful for the sole to support rolling over (rocker sole), however in many cases it's also prescribed by a doctor directly.

It's highly difficult to make a well-designed, durable, and aesthetic sole with traditional techniques. Over the last years we developed a sole family which meets most needs. Our favourite, the 7mm cupsole with a hidden rocker, is fully in line with professional requirements, has a sporty appearance, also hides the extra depth of the shoe.

Our special lining materials – antibacterial lining with ventilation functions, laminated lining – are supplied by **Moron**, one of the most prominent manufacturers in the business.

The upper part of the shoes is made of high quality, durable, qualified leather, one of our most prominent suppliers is **Dani** from Italy.

INNOVATIVE TECHNOLOGY

The results of the clinical research conducted with our nearly 100 diabetic clients, approved by OGYÉI (National Institute of Pharmacy and Nutrition), shows a **satisfaction rate exceeding 90%**, the foot problems of patients have decreased and their mobility has increased.

The number of amputations due to diabetes in Hungary is 4 times higher than the international average, and 7 times higher than in some countries with advanced health care. The number of amputations, the torture and the costs of ulcer treatment, the related rehabilitation and sick leave costs, and the lost income due to dropping out of work, could all be reduced by orders of magnitude if all diabetic people would think about preventing their feet in time.

Instead of painful bunions and hammer toes, **instead of taking tons of painkillers for waist and back pain, you should walk in well-designed comfort shoes!**

Make a move in time and prevent a future problem. You can save lots of future pain and painful costs.

In case of foot deformities and advanced diabetes, the price of medical shoes is at least partly supported by Health Insurance Funds. However, you should not wait until you need this kind of support.

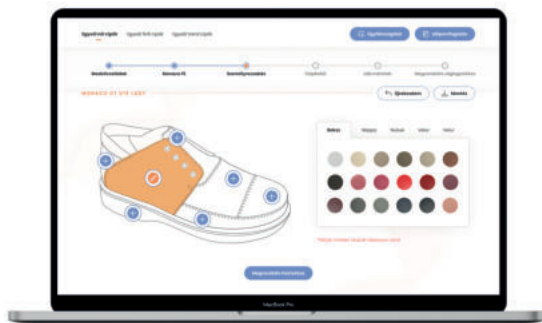

We have a professional record of 30 years, a Hungarian manufacturing background and a manufacturing experience of hundreds of thousands orthopedic and custom-made shoes.

Our **MSZ EN ISO 9001:2015** and **MSZ EN ISO 13485:2016** quality management certificates can guarantee complete control and traceability of the manufacturing process and materials used in the process.

As the first Hungarian manufacturer we comply with the **EU Medical Device Regulation (MDR)** and we registered into the **National Medical Register (NOR)** and into the **EUDAMED European manufacturer register**. Our unique process and professional background ensures that we make the best shoes possible for you.

With the professional guidance of chief podiatrist **Dr. Róbert Mező**, Hungary's most famous shoe fashion designer, **Réka Vágó** has taken the concept of orthopedic and diabetic shoes to a new level: they're no longer ugly or discriminatory. The color variations shown in the catalogue are recommended by Réka in line with current fashion. Your choice: you either accept ideas from the designer or you design your own unique, cool comfort shoes or - if needed - correctional footwear with your own color design and material choice.

Custom insoles in shoes

1. Corrective insole

Custom insole into orthopedic shoes to support and correct the longitudinal and transverse arch of the foot. Relieves pain caused by flat feet, promotes gait stability, reduces pain in the knee, hip and back.

Types:

- Adhesive leather
- Sandwich insole on artificial cork
- Sandwich insole PU

2. Diabetic insole

Insole made from supporting and void-filling layers, the surface of which is covered with a special foam material. Its primary function is to reduce shear stress while walking, and to equalize pressure on the sole of the foot.

Types:

- Dr. Orto Special PU
- Dr. Orto Soft
- Dr. Orto Special EVA
- Dr. Orto Special artificial cork
- Dr. Orto Soft PU
- Dr. Orto Plus

3. Custom foot orthosis

Properly designed to the unique deformity of the foot, fits the longitudinal arch in a total contact way. It relieves the overloaded areas of the foot as directed by a doctor. A corrective insole which is recommended by the expert mainly in case of severe foot deformity – eg. clubfoot, fallen arch, pronated foot. Its design is finalized at the delivery.

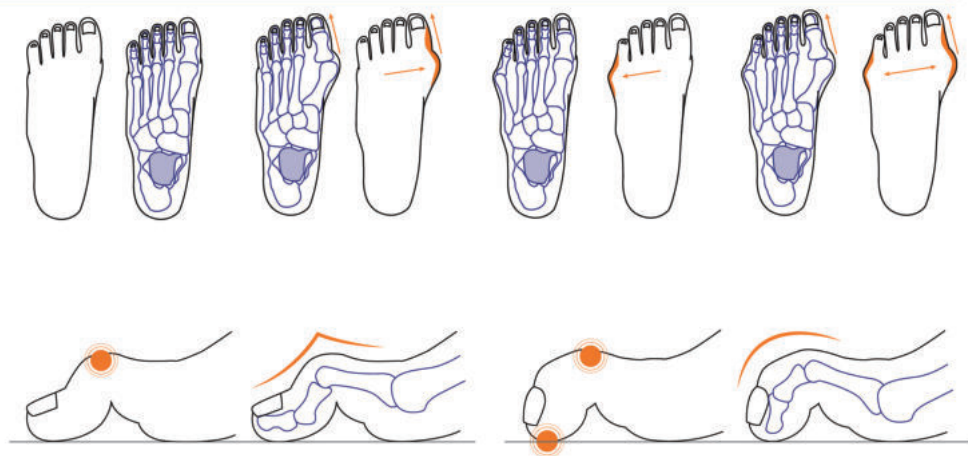

Check out our website to see our insoles!

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

CUSTOM FOOTBED

Custom footbeds are made of a multilayered material to ensure proper weight distribution and weight reduction. They have special lifters in them if needed, their thickness differs from usual insoles. In such cases, an extra high heel counter is needed in order to keep the heel in the proper position. To elevate the counter, a design element was inserted for a better aesthetic appearance.

SEVERE FOOT DEFORMATION

When designing footwear for severely deformed feet, basic professional requirements have to be taken account.

The well-designed orthopedic shoes fit properly to the foot both during rest and walking. For stiff and immobile feet, a shoe is recommended which opens for the full length and its tongue can be fully folded out. In case of gnarly, sensitive toes with sensation disorders, it's really important to have as few seams as possible on the upper of the shoe.

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

FOR HEALTHY FEET IF YOU CAN'T LACE YOUR SHOES

The big advantage of this footwear is that you don't have to deal with laces. The disadvantage is that it's not adjustable, so it can't follow the changes of the foot during the day or with age. We have minimal possibility for adjusting at delivery. Hence we only prepare shoes like this for feet normal in shape and we only recommend this for our clients struggling with laces.

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

BERLINER COUNTER

The Berliner counter is an elevated, if needed led forward heel counter built into the orthopedic shoe, which keeps the foot in a stable position.

BAYER SPRING

The built-in Bayer spring can be used in case of a minor paralysis of the leg extensor muscles. In case of severe paralysis of the foot it is recommended to use a Bayer spring mounted on the outside of the shoe. However, this is an outdated solution. Instead, foot paralysis is mainly treated with an ankle-leg orthosis placed in the shoe. The Bayer spring is only feasible in boots. As an alternative for the Bayer spring the Allard Toe Off dynamic orthosis can be recommended as a modern solution.

BAYER SPRING

BERLINER COUNTER

ALLARD TOE OFF

Allard ToeOFF is a dynamic ankle foot orthosis which also affects the function of the knee joint. It supports the shin from the front, thus improves the gait of paralyzed patients by holding the leg and by replenishing walking energy. With its help it's possible to reach a state close to normal walking. The Allard ToeOff is indicated in case of the central or peripheral paralysis of the lower limb, the instability of the ankle, and decreased muscle strength of the leg or knee. It has the best effect in a footwear with a proper rocker sole. Can be worn with shoes, sandals, it fits under the trouser legs. It's significantly more comfortable and effective than the Bayer spring, peroneus lifter or the traditional Ankle Foot Orthosis.

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

IN CASE OF SEVERE FOOT DEFORMITY WITH BERLINER COUNTER

The Berliner counter is an elevated, if needed led forward heel counter built into the orthopedic shoe, which keeps the foot in a stable position.

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

CUSTOM FOOTBED

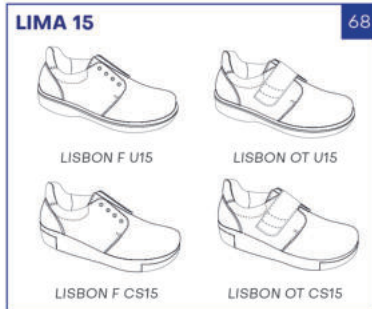

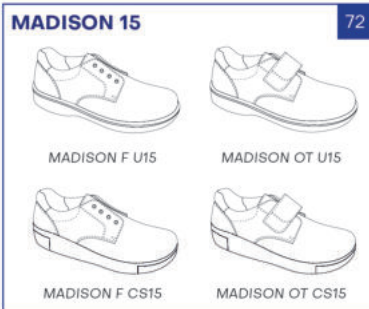

Custom footbeds are made of a multilayered material to ensure proper weight distribution and weight reduction. They have special lifters in them if needed, their thickness differs from usual insoles. In such cases, an extra high heel counter is needed in order to keep the heel in the proper position. To elevate the counter, a design element was inserted for a better aesthetic appearance.

SEVERE FOOT DEFORMATION

When designing footwear for severely deformed feet, basic professional requirements have to be taken account.

The well-designed orthopedic shoes fit properly to the foot both during rest and walking. For stiff and immobile feet, a shoe is recommended which opens for the full length and its tongue can be fully folded out. In case of gnarly, sensitive toes with sensation disorders, it's really important to have as few seams as possible on the upper of the shoe.

FOR HEALTHY FEET IF YOU CAN'T LACE YOUR SHOES

The big advantage of this footwear is that you don't have to deal with laces. The disadvantage is that it's not adjustable, so it can't follow the changes of the foot during the day or with age. We have minimal possibility for adjusting at delivery. Hence we only prepare shoes like this for feet normal in shape and we only recommend this for our clients struggling with laces.

MODELS RECOMMENDED IN CASE OF SPECIAL ORTHOPEDIC PROBLEMS

BERLINER COUNTER

The Berliner counter is an elevated, if needed led forward heel counter built into the orthopedic shoe, which keeps the foot in a stable position.

BAYER SPRING

The built-in Bayer spring can be used in case of a minor paralysis of the leg extensor muscles. In case of severe paralysis of the foot it is recommended to use a Bayer spring mounted on the outside of the shoe. However, this is an outdated solution. Instead, foot paralysis is mainly treated with an ankle-leg orthosis placed in the shoe. The Bayer spring is only feasible in boots. As an alternative for the Bayer spring the Allard Toe Off dynamic orthosis can be recommended as a modern solution.

ALLARD TOE OFF

Allard ToeOff is a dynamic ankle foot orthosis which also affects the function of the knee joint. It supports the shin from the front, thus improves the gait of paralyzed patients by holding the leg and by replenishing walking energy. With its help it's possible to reach a state close to normal walking. The Allard ToeOff is indicated in case of the central or peripheral paralysis of the lower limb, the instability of the ankle, and decreased muscle strength of the leg or knee. It has the best effect in a footwear with a proper rocker sole. Can be worn with shoes, sandals, it fits under the trouser legs. It's significantly more comfortable and effective than the Bayer spring, peroneus lifter or the traditional Ankle Foot Orthosis.

Recommended model for paralysed feet that are difficult to bend. The advantage is that the tongue can be folded out completely so that the foot can be easily fitted into the shoe.

GOOD SHOES ARE BIG HELP FOR THE FOOT

Information about custom-made shoes

To ensure that your footwear won't disappoint, please make sure to read the information below!

The biggest challenge of custom made shoe manufacturing is to make shoes which even fit problematic feet, which are comfortable and differ as little as possible from ordinary shoes. The well-designed custom-made footwear protects the foot, gives support and corrects as well. This can only be ensured if it's harder and stronger than casual footwear. At the same time, our shoes are made of materials and are designed to adapt to the foot.

You can only start using your new shoes gradually. Follow the 20-minute rule!

20-minute rule: Check your feet 20 minutes after wearing your new shoes. In case of noticing a pressure point, ie. the skin turns red, don't put your shoes back on, just wait. If the redness persists after 20 minutes, you should not wear the shoes anymore but return them to the manufacturer for adjustment. If the redness passes after 20 minutes, check your feet again after 40 minutes, repeat the previous procedure. Gradually increase the duration of wearing your shoes and only wear them constantly if you had no symptoms for 3-4 hours. If the heel of the shoes is rubbing your foot, the most common reason is that the laces are not tight enough or the velcro is not fastened properly, hence the foot is moving in the shoes. Of course poorly designed heel counters can also cause a problem. If your heels are still moving in the shoes even when laced correctly, we recommend you to seek help from an expert!

Custom-made shoes made from the right materials and with the right technology can be adjusted later as well. In case your footwear hurts your feet, take some photos of it and contact one of our shops with your shoes, photos and exact description of the problem. We recommend you to go to the shop where you picked up your shoes.

If you experience problems with our shoes, we will try to fix it.

Comfort, aesthetic appearance. The toe-shape of shoes is mainly defined by the shape of the foot. Room must be made in the shoe for a bunion, hammer-toe or other deformities. In order to have enough space for a hammer-toe, the toe of the footwear must be made higher.

Due to its elasticity, especially in wet weather, leather starts to shrink and tries to revert to its original form. Therefore the toe of leather shoes needs to be stiffened (with a cap). Without this cap, leather would tighten on painful and irritated skin.

It follows from all those that the leather of a shoe which provides good support, has to have a good hold and needs to be well-moldable, not like "glove leather" as many people would like. The upper needs to be designed so that seams won't irritate sensitive areas.

The upper of the shoes for those with sensitive feet and with diabetes is made with soft inner lining in order to reduce pressure points. These special linings ventilate steam while sweating and can be worn comfortably in the summer as well.

Action length. When someone tries on their custom-made shoes for the first time, they can easily think their footwear had been ill-fitted, because the shoes are approx. 1cm longer than their feet. However, this difference in length plays a very important role! Shoes bend slightly while walking – when the foot rolls over –, hence they shrink. This shrinking is compensated by the length difference in the toe of shoes while standing, which is called an action length.

Stabilization of the foot. One of the main purpose of a well-designed footwear is to prevent painful movements of the foot for those with problematic feet.

If certain supporting elements are built into the shoes, painful joint movements can be switched off and symptoms can be significantly reduced. Most of the time the counter is inserted into the neck of the shoes or upfront, to the side of the shoe. In this case the counter is made from special fiber leather, or from thermoplastic developed for this purpose.

GOOD SHOES ARE BIG HELP FOR THE FOOT

This type of counter properly fixes the foot and ankle joint, and provides sufficient stability even while walking. Up or forward driven counter can only be made into high neck shoes.

Design of the heel and sole. The sole of our shoes is made of non-slip material, also some soles include non-slip insoles. Wide, stable soles increase safety while walking. While walking, the ankle has to move in the phase of rolling over. The rocker sole helps rolling over. The sole of the shoe is curved, hence the sole is slightly thicker than usual and bends towards the toe of the shoe. Therefore while walking, the toe of the shoe doesn't get stuck. When rolling over, less force falls on the forefoot, this can decrease typical pain in the front part of the foot (metatarsal pain, plantar pain, big toe pain), also prevents pressure points from forming. Walking in shoes with a rocker sole puts less stress on the ankles, therefore reduces possibly painful ankle movements and reduces joint abrasion.

Flat foot insole. Proper insoles are part of custom-made shoes. Their design depends on the condition of the foot. From adulthood onwards, it's recommended to wear a flat foot insole which is suitable for correcting static abnormalities which develop over time. The cover of the insole is an important weight distribution element, hence in case of paraesthesia we make our insoles thicker than usual. In case of advanced diabetes only this type of insole is recommended. Some problems can only be solved by custom-made footwear.

Over the last few years, Dr. Orto developed world class manufacturing of custom-made shoes. Fashion designer Réka Vágó and orthopedic professional designer Tamás Pádár created a collection which meets the aspects of the latest comfort shoe fashion and healthy footwear as well. The compliance with professional standards of the renewed supply is guaranteed by Dr.Orto's team of excellent professionals with many decades experience in the industry. The applied innovative technologies, domestic, Italian and Spanish materials ensure the durability of our footwear.

Dr. Orto's quality assurance system and compliance with the European Medical Device Regulation (MDR) which came into force in 2021 as the first Hungarian manufacturer, reflects the company's quality policy.

With the help of Dr. Orto's latest improvement, the Online Shoe Configurator allows you to design your own unique footwear. Such configurator at the time of the publication of our catalogue doesn't exist in custom-made manufacturing of comfort/orthopedic shoes.

Dr. Orto moved forward to meet his slogan at all levels: **„we help you to move on”.**

Dr. Mező Róbert

Head of department
Orthopedic and Rehabilitation Medicine Specialist
Master Instructor at Semmelweis University
