📑 Materials for teachers (game managers) 4.2
Reproduction chart: recovery of the fish population (in tons of fish)

- At the end of the fishing season 47 tons of fish are left in the lake.

- In the close season, the population of fish recovers. In this example, the fish population amounts to 56 tons at the beginning of the new fishing season.

- The game manager announces this figure to the players, who then decide on their catch in the new season.

- The game manager must not show this reproduction chart to the players.
