EXECUTIVE SUMMARY

Japan is by far the world's largest importer and consumer of sablefish (*Anoplopoma fimbria*). The current Japanese market for sablefish is supplied entirely by imports which in 2012 are estimated to have been about 15,000 metric tons (mt) in round weight, representing 69 percent of world sablefish catches that year.

In 2013, Japan imported 8,380 mt of frozen dressed sablefish valued at \$99 million. Although the volume of imports in 2013 was the lowest in the last 27 years, the average import price was the sixth highest. The increase in value was due mainly to strong demand, declining supply, a strong yen, and a consequent rise in price to suppliers of sablefish.

The United States is the primary supplier of sablefish to Japan. Japanese imports of sablefish from the United States in 2013 were 7,655 mt valued at \$90.6 million.

Sablefish is usually sold directly to licensed buyers at production-center wholesale markets located at Japanese ports of landings and consumer-center wholesale markets located in cities with populations of more than 200,000. It is also sold directly to processors or representatives of supermarket chains. Wholesale prices at the Tokyo Central Wholesale Market, the largest consumer-center fish wholesale market in the world, become price indices for fishery products. About 37 percent of Japanese imports of frozen dressed sablefish are sold at the Tokyo Central Wholesale Market.

Prices of frozen dressed sablefish are primarily determined by supply and demand, but prices of competitive fish, and the dollar-yen exchange rates are also important. Prices usually rise from late fall through winter and decline substantially during summer. In 2013, however, prices did not show a significant decline during summer, due to reduced imports and low inventories.

Sablefish most directly competes for market share with Patagonian toothfish (*Dissostichus eleginoides*). Japanese imports of Patagonian toothfish in 2013 totaled 2,054 mt (1,952 mt of dressed Patagonian toothfish and 102 mt of fillets Patagonian toothfish) valued at \$20 million. Total supply of Patagonian toothfish for 2013 decreased about 14 percent from the 2,382 mt imported in 2012.

Sablefish products imported into Japan are subject to tariffs. As Japan and the United States are signatories to the World Trade Organization (WTO), WTO tariffs apply to U.S. exports of fishery products. The current tariff for fresh or frozen sablefish products is 3.5 percent, calculated as a percentage of cost, insurance, and freight (CIF) value.

INTRODUCTION

Sablefish is an economically important groundfish species inhabiting the continental shelf and slope of the North Pacific Ocean and the Bering Sea. The resource has been exploited by U.S. and Canadian fishermen since the end of the 19th century. Other countries began fishing for sablefish after the middle of the 20th century.

Japan is presently the world's largest market for sablefish, absorbing about 69 percent of total world production in 2012. Japanese catches of sablefish, mostly near foreign coasts, were at one time the largest in the world. However, with the advent of extended jurisdiction, the Japanese fishery was eliminated off Canada after 1980, off the Soviet Union in 1986, and off the United States in 1987. By 1990, the Japanese sablefish fishery had been completely shut down and since then Japanese demand for sablefish has been supplied entirely by imports.

The United States has been the world's largest harvester of sablefish since 1978 and the economic importance of the sablefish resource has increased significantly in recent years. In 2012, the U.S. sablefish harvest contributed close to \$141 million ex-vessel value to U.S. commercial fishermen and ranked third in value among groundfish species (U.S. Department of Commerce 2014). The United States is the largest supplier of sablefish to Japan.

This report provides a detailed examination of the Japanese sablefish fishery, imports, and market, in order to identify potential export opportunities for U.S. producers.

WORLD FISHERY

Sablefish is widely distributed along the continental shelf and slope of the North Pacific Ocean from Baja California through Alaska and the Bering Sea, and westward to Japan (Sasaki 1985). The resource has been exploited by U.S. and Canadian fishermen since the end of 19th century, but catches were relatively small averaging 4,775 metric tons (mt) from 1915 to 1957 (Low et al. 1976). Until 1958, fishermen from the United States and Canada accounted for nearly all landings of sablefish (International North Pacific Fisheries Commission 1972).

Japan in 1958 and the U.S.S.R. in 1964 began fishing for sablefish in the Bering Sea (Table 1 and Figure 1). Total catch of sablefish by all nations reached a high of 66,000 mt in 1972, with Japan landing 85 percent of the fish. During the late 1970s, the Republic of Korea and other countries including Poland, Germany, and Bulgaria began to catch sablefish off Alaska (FAO 2014). Substantial catches by the U.S.S.R. and the

Republic of Korea were reported from 1966-1975 and 1977-1983, respectively. However, the establishment of the U.S. and Canada's 200-mile Exclusive Economic Zone (EEZ) in 1977 greatly reduced the catches of sablefish by foreign vessels in those waters. Increased development of domestic sablefish fisheries in the United States and Canada led to the elimination of foreign catches of sablefish in those nations' EEZs.

Since 1978, the United States has been the world's largest harvester of sablefish, producing over 89 percent of the world total in 2012. Canada has been a distant second since 1984. Only the United States and Canada harvested sablefish in 1990-1994 and 1997-1999, according to FAO catch statistics (FAO 2014). In a number of countries landings of sablefish were not recorded in 1990-1994 and 1997-1999, although sablefish was exported to Japan during those years. These countries included Argentina, Mexico, the Republic of Korea, New Zealand, Morocco Uruguay, China, Democratic People's Republic of Korea, Russia, and Thailand (Table 3).

Total sablefish landings in the United States steadily increased from 19,000 mt in 1983 to a peak of 49,000 mt in 1988. The landings have since declined in all fishing areas (Figure 2). In 2012, the United States landed about 19,000 mt of sablefish, of which 13,500 mt or 72 percent of the total catches were caught in the waters off Alaska.

Harvest of sablefish by Canada has gone from 383 mt in 1958 to a record high of 5,770 mt in 1988. The landings have since declined.

Sablefish are taken primarily with bottom trawl, longline, and pot gear. Trawls capture sablefish in mixed-species catches of a variety of groundfishes, whereas longline and pot gears more specifically target sablefish. There is little recreational fishing for sablefish, mostly because they live at depths too great for most kinds of recreational fishing gear (Leet et al. 1992 and U.S. Department of Commerce 2014).

JAPANESE FISHERY

The Japanese sablefish fishery began in 1958 in the Bering Sea (Noorin Keizai Kenkyusho 1965). The fishery grew rapidly in this area and catches peaked in 1962 at 28,381 mt (Fig. 3 and Table 2). As stock abundance in the Bering Sea declined due to expanding fisheries, the fishing fleet extended its area of operation westward along the Aleutian Island chain and into the northeastern Pacific Ocean. Catches in the Aleutian Islands region remained at low levels, with a peak catch in 1972 of 3,262 mt. In the northeastern Pacific Ocean, sablefish catches increased rapidly to a peak of 40,553 mt in 1972. The Japanese sablefish fishery historically was not very active off the coast of Washington, Oregon, and California. The peak year of Japanese sablefish harvest from all fishing areas was 1972 when 56,255 mt of sablefish were harvested, which was over 85 percent of the world catch for that year (Table 1). From 1961 through 1976, annual Japanese catches averaged 30,708 mt. The majority of the catch took place in U.S. waters.

Following the passage of the Magnuson Fishery Conservation and Management Act (MFCMA) in 1976, resources in U.S. waters came under direct management of the United States and catch restrictions were implemented. Japanese harvest of sablefish has since ceased. Prior to enactment of the MFCMA in 1977, Japan was the world's largest sablefish harvesting nation, but its share of the world catch decreased from about 89 percent in 1961 to less than one percent in 1986. Japanese sablefish fishing in the U.S. Exclusive Economic Zone (EEZ) ended in 1986

in the Gulf of Alaska and in 1987 in the Bering Sea and Aleutian Islands as a result of implementation of the MFCMA.

In Canadian waters, the Japanese catch quota was reduced from 3,000 mt in 1977 to 200 mt in 1980. After 1980, the Japanese directed fishery for sablefish off Canada was eliminated (McFarlane and Beamish 1983). In 1986, Japanese stopped fishing for sablefish in Soviet waters (U.S. Department of Commerce 1986).

From 1987 through 1989, the Japanese sablefish fishery was conducted only in international waters and catch amounts were insignificant. The Japanese have not harvested sablefish since 1990.

IMPORTS

Japan is the world's largest importer of sablefish. In 2013, Japan imported 8,380 mt of dressed fresh and frozen sablefish valued at about \$99 million (Tables 3 and 4). The United States has consistently been the leading supplier of sablefish to Japan, providing about 91 percent of the 2013 total. Canada has been a distant second with supplies of about 9 percent of the total. During the last 27 years, 15 other countries supplied less than one percent of the total.

Although the volume of imports in 2013 was the lowest in the last 27 years, the average import price was the sixth highest (Table 4 and Figure 4). The average import price advanced from \$4.14/kg in 1987 to \$11.81/kg in 2013. Good demand, declining supply, higher wholesale prices, and the strong yen (Appendix 1) contributed to the increase in value.

Japan did not begin to report separate import statistics for sablefish until 1987. Prior to that time, sablefish imports were lumped together with those of cod and cod-like species. According to unofficial statistics compiled by a Japanese fishery industry newspaper, Japan imported between 3,490 mt and 3,990 mt of sablefish in 1983, 8,647 mt in 1984, and 12,100 mt in 1985 (Suisan Keizai Shinbun Sha 1985 and 1986).

Japan's imports of sablefish increased sharply from 1983 to a high in 1988, but have since shown a downward trend. Imports of sablefish in 2013 were the lowest in volume since 1983, and 73 percent less than the record year of 1988. This is mostly because of decreasing catches and exports by the United States.

Japan regulates imports of fishery products with import quotas (IQ) and tariffs. Over the years, Japan has relaxed its IQ and reduced trade barriers through multilateral and bilateral trade negotiations. Tariffs have been gradually cut by about one-third since 1995 on a number of fishery products.

Sablefish products imported into Japan are subject to tariffs, but not IQ. As Japan and the United States are signatories to the World Trade Organization (WTO), WTO tariffs apply to U.S. exports of fishery products. The current tariff for fresh or frozen sablefish products is 3.5 percent, calculated as a percentage of cost, insurance, and freight (CIF) value.

SUPPLIERS

United States

Exports of U.S. sablefish to all destinations increased from a negligible amount in 1981 to a peak of 23,000 mt in 1989, but have since shown a downward trend (Tables 6 and 7). Japan is still the U.S.'s foremost export market for sablefish and in 2013 purchased 78 percent of total U.S. exports of sablefish. The average U.S. export price of sablefish to Japan increased 22 percent to \$10.53/kg in 2013 from \$8.65/kg in 2007. The increase in price was due mainly to the appreciation of the Japanese yen relative to the U.S. dollar and higher demand for sablefish in Japan.

Exports of U.S. fishery products have greatly benefited from the weaker dollar relative to the Japanese yen in recent years. The annual average value of the U.S. dollar relative to the yen was 17 percent lower at 98 yen/U.S. dollar in 2013 from 118 yen/U.S. dollar in 2007 (Appendix 1). Thus even if Japanese sablefish prices had remained unchanged, prices paid to U.S. exporters would have increased. The Japanese annual average import price of sablefish in 2013 was 5 percent lower in the yen price but 15 percent higher in the dollar price from 2007 level.

Hong Kong, the second largest export market for U.S. sablefish in 2013, has substantially increased its imports of sablefish, from less than one percent of U.S. exports in 1991 to 7 percent in 2013.

Canada

Canada exported 1,105 mt of sablefish in 2013, valued at Canadian \$12.1 million, a decrease of 35 percent in quantity and 31 percent in value over 2012 exports (Tables 8 and 9). Canada's exports of sablefish between 2001 and 2013 have fluctuated within a fairly narrow range, 1,100-2,400 mt.

Japan continued to be Canada's single largest export market for sablefish in 2013, taking 72 percent by volume and 78 percent by value of Canada's sablefish exports. Compared to 2012, although total quantity remained almost unchanged, value was down 15 percent.

After Japan, the United States has been the second most important market for Canadian sablefish, buying 15 percent of Canada's total sablefish exports in 2013. Canada exported 161 mt of sablefish to the United States in 2013, a 75 percent decrease over 2012. Canada's exports of sablefish to the United States have fluctuated between 95 and 744 mt since 1997.

SUPPLY

Japan is the world's largest market for sablefish, consuming an average of 26,900 mt of sablefish or 88 percent of the world's sablefish production during 1987-2012 (Tables 1 and 10). Nearly 87 percent of U.S. sablefish catch and 84 percent of Canadian sablefish catch were used to supply the Japanese market during the same period. In 2012, the combined catches of the two countries totaled 21,015 mt, with the United States accounting for 18,734 mt (89 percent). Japanese imports from the two countries totaled approximately 14,425 mt in round weight equivalent that year. Current Japanese demand for sablefish is supplied entirely by imports.

CONSUMPTION

Sablefish is a popular fish in Japan. It is sold in retail stores for home consumption in steak and fillet form, and as "kasuzuke" (marinated in Japanese rice wine lees). It is prepared in various ways for the table by the Japanese. The most popular dish is fish stew, which typically consists of sliced fish, vegetables, and soup stock. The dish is consumed primarily during the winter months. Sablefish steaks and fillet, as well as kasuzuke, are also used in grilled, broiled, or baked form and consumed year round. Sablefish may be used as "sashimi" (thinly sliced raw fish), especially in northern Japan, but it is not used in smoked, dried, or canned form.

MARKET

Frozen dressed sablefish is usually sold directly to licensed buyers, with a set price at production-center wholesale markets located at Japanese ports of landings and consumer-center wholesale markets located in cities with populations of more than 200,000. Sablefish is also sold directly to processors, chain supermarkets, and department stores. The largest consumer fish wholesale market is the Tokyo Central Wholesale Market. In 2013, this market handled about 515,000 mt of fishery products valued at about \$4.6 billion (Tokyo Metropolitan Government). It therefore plays an important role in providing information on the supply and demand of fishery products in Japan. Also, the wholesale price determined in the Tokyo Central Wholesale Market frequently serves as a price index for fishery products throughout the world. Between 1987 and 2013, an average of 37 percent (6,252 mt) of Japanese imports of frozen dressed sablefish were sold at the Tokyo Central Wholesale Market (Figure 5, Tables 3 and 11).

Wholesale prices for frozen dressed sablefish vary widely, depending on quality, size of fish, origin, supply, prices of competitive fish products, dollar-yen exchange rate, and other factors. Table 12 shows monthly and annual average wholesale prices of frozen dressed sablefish at the Tokyo Central Wholesale Market from 1986 through 2013. The average prices fluctuated considerably during that period, ranging from a low of 677 yen/kg to a high of 1,838 yen/kg and fluctuations were influenced mainly by volume of total available supply in Japan. As is usually the case, the greater the supply, the lower the price (Figure 6).

Sablefish competes in the market with Patagonian toothfish (called "mero" in Japanese), which has a similar oil content (Shokuryo Shinbun Sha January 21, 2000 and Hokkai Keizai Shinbun Sha February 23, 2000). Japanese imports of Patagonian toothfish are listed under "mero". Japanese imports of "mero" in 2013 totaled 2,054 mt (1,952 mt of dressed mero and 102 mt of fillets) valued at \$20 million (Table 13). Total supply of "mero" for 2013 decreased about 14 percent from the 2,382 mt imported in 2012.
