

**A SUMMARY OF THE CASES OF PELVIC DEFORMITY IN 30,000 LABORS.**

By H. N. Taylor, M. D., Registrar.

The following tabulations are taken from the records of the Society of the Lying-In Hospital and show only those cases in which operative procedure was required for the delivery of the child. In the early records of the hospital, the pelvic measurements in some cases are not shown, the only note under the operation being, that the pelvis was deformed.

The standard of size adopted by the hospital for a normal conjugata vera is 10 cm. and all measurements falling below this are regarded as indicating pelvic deformity.

AGE OF PATIENTS.	
Under twenty.....	13
Twenty to twenty-five .....	84
Twenty-five to thirty .....	75
Thirty to thirty-five .....	59
Thirty-five to forty .....	31

**MONTH OF GESTATION AND RESULTS TO CHILD.**

One child born at seven and one-half months, still birth.

Four children born at eight months, one still birth, two deaths, one living.

Two hundred sixty-four children born at ninth to tenth month of gestation, eighty-nine still births, seven deaths, one hundred sixty-eight living.

Total mortality children, including still births, and death after delivery is 37 per cent. This high mortality, it must be remembered includes eleven cases of prolapsed cord, two or more cases of macerated foeti and represents the mortality in the two hundred sixty-nine cases of labor complicated by deformed pelves, in which operative procedure was necessary for delivery in thirty thousand labors.

Two hundred four of the two hundred sixty-nine cases were delivered either by forceps, or version.

A comparative table of forceps and version cases is of interest:

Of the forceps cases the conjugata vera measured:

10. cm.....in.....	13 cases
9.5 cm.....in.....	50 cases
9.25 cm.....in.....	1 case
9. cm.....in.....	22 cases
8.75 cm.....in.....	1 case
8.5 cm.....in.....	7 cases
8. cm.....in.....	1 case
7.5 cm.....in.....	1 case
Not noted.....in.....	5 cases
Total.....	101 cases

Of the version cases the conjugata vera measured:

10. cm.....in.....	11 cases
9.75 cm.....in.....	1 case
9.5 cm.....in.....	33 cases
9. cm.....in.....	29 cases
8.75 cm.....in.....	1 case
8.5 cm.....in.....	14 cases
8. cm.....in.....	2 cases
7.5 cm.....in.....	4 cases
Not noted.....in.....	8 cases
Total.....	103 cases

This tabulation shows eight deaths of mothers from the following causes:

- C. N. 5633—Uraemia.
- C. N. 5799—Septicaemia Chr. Nephritis.
- C. N. 10,047—Septicaemia.
- C. N. 14,603—Rupt. Uterus, died 3rd day.
- C. N. 19,913—Caesarian Section, Septicaemia.
- C. N. 21,167—Ruptured Uterus, shock and haem, died 5 hrs, after del.
- C. N. 23,369—Caesarian Section, shock patient got up out of bed on day after operation.
- C. N. 28,382—Haem. Shock.

Seventy-two deaths of children, twenty-four after forceps and forty-eight after version.

Of the deaths following forceps cases there were two of prolapsed cord, two in which craniotomy was done, and two in which the child's skull was fractured during delivery.

Of the deaths following version there were nine cases of prolapsed cord, four of craniotomy, and one of hydrocephalus.

Eight cases were delivered by version after forceps had been unsuccessfully attempted. In five cases there resulted depressed fractures of the skull.

The Conjugata Vera measured less than nine centimeters in twenty-eight of the version cases and in eight of the forceps cases.

The following table shows the conjugata vera of these twenty-four cases in comparison to the forty-eight cases in which version resulted in still birth, or death of the child.

FORCEPS.		VERSION.	
CONJ. VERA.	NO. OF CASES:	CONJ. VERA.	NO. OF CASES.
10. cm.....	2	10. cm.....	4
9.5 cm.....	11	9.75 cm.....	1
9.25 cm.....	1	9.5 cm.....	9
9. cm.....	6	9. cm.....	15
8.5 cm.....	1	8.75 cm.....	1
8. cm.....	1	8.5 cm.....	6
7.5 cm.....	1	8. cm.....	2
Not noted.....	2	7.5 cm.....	4
		Not noted.....	6
Total.....	24	Total.....	48

---

The conclusions to be drawn from a study of these tables would seem to be those already stated by other observers. The choice between forceps and version is to be determined by the individual case, and its complications; but in a case of pelvic deformity, not in itself sufficient to preclude the possibility of extracting a living child, where the head is above the pelvic brim and the membranes intact, or recently ruptured, the cervix dilated or dilatable, version offers the better chance of extracting a living child. High forceps would seem contraindicated, in cases of pelvic deformity with the head above the brim, unless the membranes have been ruptured for some time, the amniotic fluid drained away, the uterus tonically contracted and the lower segment so thin that version would endanger its integrity.

Version is the easier operation to perform and is safer to mother and child, than high forceps, in cases of pelvic deformity, with the head above the brim and otherwise uncomplicated.
